Miguel believes that lead levels in Flint are being affected by the lack of Corrosion Control being conducted by the City, since the LCR requires 2 6-month initial monitoring for a new source. Steve Busch stated that in the Lead sampling pool, almost all of the lead sample sites are lead service lines, and the State is not seeing large increases in lead levels at the tap. Miguel suggested that EPA experts in Lead, Mike Schock; and in distribution systems, Darren Lytle, be added to the Flint drinking water advisory committee to assist the City/State in determining the best way to proceed to minimize lead in the City's drinking water during the interim use of the Flint River, and subsequent use of Lake Huron water.

Miguel said he will send Mike Schock and Darren Lytle's contact information to Steve and Mike. Steve pointed out that the City is following the LCR requirements, and completing the requirements in a timely manner. Miguel's point is that since the LCR was promulgated 20+ years ago, that research and different situations, like Washington D.C., have educated scientists, experts, and regulators that the existing requirements in the LCR may not be as protective as previously thought. Thus, he can only make recommendations as to how to revise sampling protocols. And Miguel acknowledges that it may be another year before these regulation changes are promulgated in the Long-Term Lead and Copper Rule. In December 2015, the NDWAC recommendation is expected.

The Region asked the State if the Flint River will be a permanent supplemental source of drinking water, once the City of Flint connects with the Karegdodi pipeline from Lake Huron. Mike Prysby said that the City is currently pumping 22MGD, but the City has 40-50 MG of storage. The City is currently working on reducing its unaccounted for water losses, and these water losses are dropping. The State, through the Governor's office, provided disadvantaged system funding, $2M which includes $900K for lead detection, and pipe inspection.

Subject: Re: Draft Notes from Michigan semi-annual call on 6/10

OK. Sorry for the delay in getting back to you. **Nonresponsive** **Nonresponsive**

So this is what I came up with to send to the State about item 1.d. What do you think? See item in RED--ACTION

Submittal of the lead and copper reporting form

(From the 6/10 agenda) MDEQ commits to requiring CWSs and NTNCWSs to submit the lead and copper reporting form via the annual monitoring letters to each system, tracking CWSs and NTNCWSs submittal of the lead and copper reporting form, and commits to issuing violations for failure to submit the lead and copper reporting form. The reporting form provides the address of the sample site, designates sampling site selection criteria, and explanation(s) for any changes in sampling sites.

STATE: Dan Dettweiler stated that the NCWS program was not in a position to do this for the NTNCWSs at this time. Tom Murphy asked how does WaterTrack handle/track high lead results? Tom M said there is a truncation issue on the sample location name field—Dan acknowledged that this problem has been identified, and the Department of Technology Management and Budget (DTMB) has been trying to fix this problem, but it is a challenging problem. However, sample sites for NTNCWSs are identified by LHDs during the sanitary survey and are documented in the sanitary survey report. The LHDs check the pdf of laboratory results that clearly states where the sample was taken, and calculates the 90th percentile to verify the ALE thus, the oversight for the LCR is good. However, Dan the requirement to send in the lead and copper reporting form is not currently in the LHD annual monitoring letter sent to each system. The NTNCWSs do not couple this form to the Lead Consumer Notice, as does the CWSs. Kris Philip pointed out that the LHDs select the sample sites, thus when they are calculating the 90th percentile, they are actually double checking the sites with the results.

ACTION: From our discussion, I believe we concluded that at this time, the LHDs are actively reviewing the lead and copper results, and the sample locations as they were calculating the 90th percentile; thus, these activities were acceptable at this time to meet this requirement. It was my understanding that the actions described above that are conducted by the LHDs in reviewing the lab results which includes the sample site, and calculating the 90th percentile; were being conducted at ALL the NTNCWSs by the

LHD staff.

However, some others in the room thought that these activities were only to be conducted if there was an ALE, or if any of the samples at a system were over the AL.

Are the above activities conducted by the LHD to review the lab data and sample site information, and then calculate the 90th percentile correct? Could you clarify for what systems get this type of review by the LHD staff?

Kris Philip said that the CWS program is requiring that the systems submit the form, but they are not enforcing whether or not the system submits the form. Often, the CWS will submit the Lead Consumer Notice and the Lead and Copper reporting form together. Kris said if 90%+ are already submitting the forms, then the State will agree to follow-up and enforce this requirement. But, if less than that, will probably be too much of a burden. Kris said they may change the way DEQ is tracking in SDWIS during FY 2016. But, the Region said SDWIS-Prime probably won't be available until 2017 at the earliest.

ACTION: Kris Philip will research with the District Offices to determine the current submittal rate of the lead and copper reporting form; and report back to the Region.

Subject: Draft Notes from Michigan semi-annual call on 6/10

All—Below are my draft notes from our call last week, June 10, 2015. Thank you all for participating. Please feel free to edit as needed, to make sure I documented our discussion/agreements correctly.

Please see the red highlighted section—I need help on this one.

I only have written down 2 Action Items. Any I missed?

Please provide me changes/edits by Friday COB. Thank you!

Jen

Attendees:
MDEQ: Liane Shekter-Smith, Richard Benzie, Carrie Monosmith, Kris Philip, Dan Dettweiler, Marjorie Rodriguez-Student, Kevin Holdwick, Mike Prysby, Dana DeBruyn, Steve Busch
EPA Region 5: Tom Poy, Rita Bair, Nick Damato, Janet Kuefler, Michele Palmer, Tom Murphy, Heather Shoven, Cary McElhinney, Andrea Porter, Miguel Deltoral, Mostafa Noureldin

Summary:

1.Changes in Lead Disinvestments and Commitments for FY 2016 ARDP—for discussion: Due to our extreme focus on lead in drinking water, this is the consensus here.

a. Consumer notification of tap results at NTNCWSs:

(Suggested wording) The NCWS program commits to full implementation of the lead consumer notification of tap results requirement, to begin in CY 2016. Region 5 will assist in a notification outreach effort in late FY 2015 to remaining 698 NTNCWSs that are not schools/daycares, to begin providing lead consumer notice in CY 2016. NCWS program commits to include information on providing lead consumer notice in the annual monitoring letter sent to all NTNCWSs for CY 2016.

STATE: The State found this change in the wording acceptable.

b. Collection of Lead samples at NTNCWSs during June – September 2016 timeframe

(Suggested wording) NCWS program commits to including information in the applicable NTNCWS annual monitoring letters of the requirement to collect their annual/triennial lead sample between June and September only, during CY 2016. The MDEQ NCWS program currently does not have the capability to easily track lead sampling compliance within this specific timeframe.

STATE: The State found this change in the wording acceptable.

c. Follow-up Actions for NTNCWSs that sample outside of June-September 2015 timeframe

(From 5/5/15 call notes w/EPA) MDEQ commits to providing Region 5 with all CY 2015 lead (and copper?) sample data for all NTNCWSs by March 2016 so that EPA can analyze how many PWSs monitored outside the June through October timeframe. EPA commits to follow-up with MDEQ to discuss follow-up actions.

STATE: The State agreed to providing EPA R5 the raw lead and copper data for NCWSs for all CY 2015. The WaterTrack database does have data, but it can't generate violations. MDEQ doesn't commit to enforcing against 2016 violators in FY 2016. The State said, it is planning on disinvesting in enforcing against these violators due to limited capability of WaterTrack; however, if the State's noncommunity data management capabilities improve during FY 2016, implementation of this disinvestment may become a reality.

d. Submittal of the lead and copper reporting form

(Suggested wording) MDEQ commits to requiring CWSs and NTNCWSs to submit the lead and copper reporting form via the annual monitoring letters to each system, tracking CWSs and NTNCWSs submittal of the lead and copper reporting form, and commits to issuing violations for failure to submit the lead and copper reporting form. The reporting form provides the address, description (, and specific location at NTNCWSs) of the sample site, designates sampling site selection criteria, and explanation(s) for any changes in sampling sites.

STATE: Dan Dettweiler stated that the NCWS program was not in a position to do this for the NTNCWSs at this time. Tom Murphy asked how does WaterTrack handle/track high lead results? Tom M said there is a truncation issue on the sample location name field—Dan acknowledged that this problem has been identified, and the Department of Technology Management and Budget (DTMB) has been trying to fix this problem, but it is a challenging problem. However, sample sites for NTNCWSs are identified by LHDs ~~The are actually identified by the LHDs~~ during the sanitary survey and are documented in the sanitary survey report. After NTNCWSs have a lead and/or copper action level exceedance (ALE), LHDs check ~~T~~the laboratory pdf results reports of the analyses which clearly states where the sample was taken, and recalculates the 90th percentile to verify the ALE thus, the oversight for the LCR is good .~~, and selects the sites for the NTNCWS systems;~~ But, Dan said the requirement to send in the lead and copper reporting form is not currently in the LHD annual monitoring letter sent to each system. The NTNCWSs do not couple this form to the Lead Consumer Notice, as does the CWSs. Kris Philip pointed out that the LHDs select the sample sites, thus when they are calculating the 90th percentile, they are actually double checking the sites with the results. However, Water Track only allows the calculation of a 90th percentile where, within a group of samples collected at a water system, at least one of the sample results exceeds the action level. Therefore, "In lieu of" requiring NTNCWS to submit a lead and copper reporting form, MDEQ also needs to begin flagging every NTNCWS sample Lead result above 15 ug/l ("and Cu result above 1.3 mg/l"). LHDs need to begin opening and reviewing each L/C sample result for these systems in WaterTrack (WT) and the laboratory pdf file report of the analysis to determine if it was taken from a valid sample site, instead of only reviewing the L/C sample summary page for the system, which does not include sample results.

Also, WT needs to re-programed or LHDs need to begin recalculating the 90th percentile correctly where less than 5 samples were collected and WT used the average of the two highest results instead of the highest result. (two examples R5 has noted are:

MI6120171, Sun Chemical Company
LHD should have reported a Lead 90th percentile value of 114 ug/l (highest of 4 sample results) instead of 84 ug/l for second half of 2011 (2009-2011 CP). System only collected 2 of 4 required L/C samples for 2012-2014 CP. LHD issued system an LCR M/R violation for 2012-2014 CP (and reported a Lead ALE for these samples in WT (90th percentile not provided by WT and not in SDWIS yet). LHD should report a Lead Lead 90th percentile of 25 ug/l, (highest of 2 sample results).

MI8020265, Coca Colo Refreshments
System's Lead ALEs for the first halves of 2012 and 2014 should have been reported with 90th percentile values equal to the highest Lead result of the 4 samples collected during these CPs: 122 ug/l (instead of 86.4 ug/l) for first half of 2012 and 21 ug/l (instead of of 19 ug/l) for the first half of 2014.

~~(I believe we concluded that at this time, the LHDs are actively reviewing the lead and copper results, and the sample locations as they were calculating the 90th percentiles; thus, these activities were acceptable at this time to meet this requirement. The Region would like to add that, at this time, this conclusion would be subject to State's annual audit reviews.)~~

Kris Philip said that the CWS program is requiring that the systems submit the form, but they are not enforcing whether or not the system submits the form. Often, the CWS will submit the Lead Consumer Notice and the Lead and Copper reporting form together. Kris said if 90%+ are already submitting the forms, then the State will agree to follow-up and enforce this requirement. But, if less than that, will probably be too much of a burden. Kris said they may change the way DEQ is tracking in SDWIS during FY 2016. But, the Region said SDWIS-Prime probably won't be available until 2017 at the earliest.

ACTION: Kris Philip will research with the District Offices to determine the current submittal rate of the lead and copper reporting form; and report back to the Region.

2. Enforcement Update with Heather

NTNCWSs under Bottled Water agreements due to Arsenic MCL violations:
Per discussions with Region 5 and the February 2014 EPA/OECA memo, MDEQ has closed the old Arsenic open-ended MCL violations; however, no further quarterly monitoring is being conducted at the (±27) systems that are still under bottled water agreements. Thus, no more arsenic MCL violations will be reported for these systems and these systems will not become priority systems (ETT score of 11 or more) since only one arsenic MCL violation will be reported (5 points) even though they have a longstanding issue with arsenic noncompliance. The Region would like to discuss the pros and cons of placing these PWSs with arsenic MCL violations on quarterly monitoring as required under 40 CFR Section 141.23(c)(7); and brainstorm possible solutions.

Heather provided an update on how the State is doing in returning ETT systems to compliance; the State is doing very well in achieving its commitment for FY 2015. Heather said the Region is glad to see the

State and LHD prioritization of implementation of the drinking water program and NTNCWS schools and daycares.
Referring to the NTNCWSs under BW agreements that are in violation of the Arsenic MCL, Heather said that since there are no more open-ended MCL violations in SDWIS, that no MCL violations can be reported to SDWIS unless there is monitoring to show the system is in non-compliance. Even though the LHD has indicated that these systems are drinking bottled water for public health protection, the use of bottled water cannot be a permanent solution to the fact that the system's drinking water at the tap continues to exceed the MCL for arsenic. Dan said there are 22 systems, where 8 are schools, that should be conducting quarterly monitoring. Dana said that letters have been sent to these 22 systems to require quarterly sampling for arsenic; these 22 systems are in 10 different counties so the message from the State is consistent. A secondary effect of this new requirement for the systems, may be that they transition to another water source or install treatment sooner.

The State voiced a concern that multiple quarterly violations could potentially affect the State's relationship with the LHDs financially. Genesee and Oakland Counties have quite a number of noncommunity water systems. Multiple quarterly violations could affect the Dept of Community Health's determination as to whether the LHDs are meeting their minimum program requirements; thus receive full funding for their work with the noncommunity systems for the drinking water program. The LHDs cannot have more than 20% of their systems with violations. The Region wonders how much funding would be cut from a LHD contract if it exceeds the 20% noncompliance level set in the contract?

3. Status of Flint

a. TTHM levels for May—Due to MDEQ district engineer June 10-RECEIVED; see link to results

https://www.cityofflint.com/2015/06/01/may-water-testing-results-show-all-locations-are-within-acceptable-limits-for-tthm/
All samples below the TTHM MCL; one site still has an LRAA above the MCL but decreased from 105 ppb in Feb to 93.5 ppb in May.

Mike Prysby said he is getting ready to issue the construction permit to the City of Flint to install a GAC filter in July, that will remove more TOC to further reduce the potential of developing TTHMs. Mike said he has already issue a construction permit for a transmission line within the City that will help reduce water age.

b. Lead in Flint

Our discussions with MDEQ indicate that no phosphates/corrosion control has been added to the system since April 2014 when the source of drinking water changed to the Flint River. We understand that the City is just finishing up its second set of 6-month initial monitoring for lead; where the results will probably warrant a Corrosion Control Study to be conducted. Since Flint has lead service lines, we understand some citizen-requested lead sampling is exceeding the Action Level, and the source of drinking water will be changing again in 2016, so to start a Corrosion Control Study now doesn't make sense. The idea to ask Flint to simply add phosphate may be premature; there are many other issues and factors that must be taken into account which would require a comprehensive look at the water quality and the system before any treatment recommendations can/should be made. Miguel is recommending MDEQ and EPA? approach Flint about formally requesting EPA's Office of Research and Development in Cincinnati support on the lead in Flint drinking water issue, and request that Mike Schock, ORD, and possibly Darren Lytle, ORD, to participate in Flint's drinking water advisory committee so that a comprehensive evaluation on how to proceed can be discussed.

Miguel provided a brief summary of the high lead results found at the residence of Citizen name / Ex. 6 in Flint. Miguel will follow up with a written summary of the work conducted, sample results, and conclusions.
Miguel believes that lead levels in Flint are being affected by the lack of Corrosion Control being conducted by the City, since the LCR requires 2 6-month initial monitoring for a new source. Steve Busch stated that in the Lead sampling pool, almost all of the lead sample sites are lead service lines, and the State is not seeing large increases in lead levels at the tap. Miguel suggested that EPA experts in Lead, Mike Schock; and in distribution systems, Darren Lytle, be added to the Flint drinking water advisory committee to assist the City/State in determining the best way to proceed to minimize lead in the City's drinking water during the interim use of the Flint River, and subsequent use of Lake Huron water.

Miguel said he will send Mike Schock and Darren Lytle's contact information to Steve and Mike. Steve pointed out that the City is following the LCR requirements, and completing the requirements in a timely manner. Miguel's point is that since the LCR was promulgated 20+ years ago, that research and different situations, like Washington D.C., have educated scientists, experts, and regulators that the existing requirements in the LCR may not be as protective as previously thought. Thus, he can only make recommendations as to how to revise sampling protocols. And Miguel acknowledges that it may be another year before these regulation changes are promulgated in the Long-Term Lead and Copper Rule. In December 2015, the NDWAC recommendation is expected.

The Region asked the State if the Flint River will be a permanent supplemental source of drinking water, once the City of Flint connects with the Karegdodi pipeline from Lake Huron. Mike Prysby said that the City is currently pumping 22MGD, but the City has 40-50 MG of storage. The City is currently working on reducing its unaccounted for water losses, and these water losses are dropping. The State, through the Governor's office, provided disadvantaged system funding, $2M which includes $900K for lead detection, and pipe inspection.

4. Update on WaterTrack to SDWIS-State: The migration of WaterTrack data to SDWIS-State was number 39 on the Dept of Technology Management and Budget's (DTMB) project list last year; this year it is

number 30. It doesn't appear this project has a high priority. Does the State have any new information on the progress of this project?

Dan said that the migration of WaterTrack data to SDWIS-State has moved to a priority of 26 with DTMB so far this year. But Dan said they are going to take this project out of the que, since Ronda Page has returned to the drinking water program from DTMB. Ronda said she re-estimated DTMB's involvement in this project to be far less than originally thought, so there is no need for any program developers or the tech team. This project will only need the Data Team and the web designers only. Ronda said they can set-up on a new server and migrate the data from WaterTrack to SDWIS-State themselves; in-house. Kris Philip remembers migrating the CWS data to SDWIS-State, so she can be a resource for this project. The parts that are needed to be completed by DTMB could be contracted out. Cary McElhinney said that there is a process of withholding PWSS grant funds and re-directing the funds to a HQ contract with SAIC. Richard Benzie said the process worked well last year when MI used PWSS funds to contract with a HQ contractor to conduct NEEDS survey training.

ACTION: Jen will follow up with State and Tribal Programs Branch about the process and timing of holding back funds from the PWSS grant for the purpose of contracting with SAIC.

5. Consequences of cutting the State drinking water program to a "minimal program"

Jennifer had a discussion with Richard Benzie regarding the possibility of the Michigan State Legislature looking to have just a minimal drinking water program, meaning only a program with activities that are required by the Federal SDWA. Jennifer ultimately discussed this internally with Tom Poy. The minimal program suggested would cut out Operator Certification, Capacity Development, Plan Review, Cross Connection Control, Source Water Protection, among other programs that are State required. Operator Certification and Capacity Development, while not required by the Federal regulations, do have financial strings attached. And Plan review/construction permits are required by the SRF program for a loan. Any recent communication with the State Legislature that they might proceed and make this possibility a reality?

Richard and Liane said there is no current threat from the State Legislature to cut the State-funded PWSS program activities. But there is a State-wide impetus to delete old programs and regulations, so this could lead to questioning the purpose of State-funded PWSS program activities. Richard is just being proactive in preparing a justification. Richard remembers a discussion many years ago about what constitutes a "comprehensive drinking water program". Tom Poy and Jennifer commented in a previous communication with Richard that the EPA PWSS primacy program and the State-funded activities in the drinking water program were meant to complement each other. To support this statement, Jennifer sent Richard some PWSS Priority guidance from the 90's, some preamble language from the 1976 SDWA found by our attorney, and language from Section 142 of the SDWA regulations from 1976 that might assist him in his justification.

6. EPA's Resource Message at the LHD Workshop in April

From the 2014 analysis of Shared Goals 2013 data, which is compliance data, for noncommunity systems, there are increasing trends of nitrate M/R violations for both NTNCWSs and TNCWSs. We discussed this on the last semi-annual call. Analysis of the 2015 Shared Goals 2014 data (April 2015) shows an improvement—that of decreasing numbers of bacti/nitrate M/R violations.

However, in light of the upcoming implementation of RTCR in 2016, the question raised here in the Region is:
Does the State have a plan with the LHDs as to what activities must be prioritized, and what will fall off the plate? Not all LHDs will need to disinvest based upon each LHD's resources, but some poorly funded LHDs may have to disinvest in some activities/drop activities that have no risk to public health.

Carrie Monosmith said that she met with the RTCR workgroup, comprised of LHD Directors/sanitarians, last fall to identify activities that the state can disinvest in during the next several years as the LHDs begin implementation of RTCR. They could not identify any activity that could be dropped. The main thing that will help the LHDs save time is to get the electronic DWR (eDWR) going, or the CMD portal, which will drastically reduce the LHDs time in inputting laboratory data into WaterTrack/SDWIS-State. From there, they can develop electronic data forms (CROMEER compliant) that the systems can submit.

Thank you!

Jennifer

Subject: Re: Draft Notes from Michigan semi-annual call on 6/10

OK. Sorry for the delay in getting back to you. I was on a call with Andy Lausted in STPB and had to get something out to Mike Baker.

So this is what I came up with to send to the State about item 1.d. What do you think? See item in RED--ACTION

Submittal of the lead and copper reporting form

(From the 6/10 agenda) MDEQ commits to requiring CWSs and NTNCWSs to submit the lead and copper reporting form via the annual monitoring letters to each system, tracking CWSs and NTNCWSs submittal of the lead and copper reporting form, and commits to issuing violations for failure to submit the lead and copper reporting form. The reporting form provides the address of the sample site, designates sampling site selection criteria, and explanation(s) for any changes in sampling sites.

STATE: Dan Dettweiler stated that the NCWS program was not in a position to do this for the NTNCWSs at this time. Tom Murphy asked how does WaterTrack handle/track high lead results? Tom M said there is a truncation issue on the sample location name field. Dan acknowledged that this problem has been identified, and the Department of Technology Management and Budget (DTMB) has been trying to fix this problem, but it is a challenging problem. Dan stated that sample sites for NTNCWSs are identified by LHDs during the sanitary survey and are documented in the sanitary survey report. The LHDs check the pdf of laboratory results that clearly states where the sample was taken, and calculates the 90th percentile~~ to verify the ALE thus, the oversight for the LCR is good~~. However, Dan stated that the requirement to send in the lead and copper reporting form is not currently in the LHD annual monitoring letter sent to each system. The NTNCWSs do not couple this form to the Lead Consumer Notice, as does the CWSs. Kris Philip pointed out that the LHDs select the sample sites, thus when they are calculating the 90th percentile, they are actually double checking the sites with the results.

ACTION: From our discussion, I believe we concluded that at this time, the LHDs are actively reviewing the lead and copper results and the sample locations when they calculate the 90th percentile to ensure proper LCR monitoring is conducted by **ALL** NTNCWSs. ~~thus, these activities were acceptable at this time to meet this requirement~~. ~~It was my understanding that the actions described above that are conducted by the LHDs in reviewing the lab results which includes the sample site, and calculating the 90th percentile; were being conducted at **ALL** the NTNCWSs by the LHD staff. However, some others in the room thought that~~ Is that correct? Or are these activities ~~were~~ only ~~to be~~ conducted if there is an ALE, or if any of the samples at a system are over the AL? ~~Are the above activities conducted by the LHD to review the lab data and sample site information, and then calculate the 90th percentile correct?~~ Could MDEQ clarify ~~for what~~ which systems get this type of review by the LHD staff?

Kris Philip said that the CWS program is requiring that the systems submit the form, but they are not enforcing whether or not the system submits the form. Often, the CWS will submit the Lead Consumer Notice and the Lead and Copper reporting form together. Kris said if 90%+ are already submitting the forms, then the State will agree to follow-up and enforce this requirement. But, if less than that, will probably be too much of a burden. Kris said they may change the way DEQ is tracking in SDWIS during FY 2016. But, the Region said SDWIS-Prime probably won't be available until 2017 at the earliest.

ACTION: Kris Philip will research with the District Offices to determine the current submittal rate of the lead and copper reporting form; and report back to the Region.

Subject: Draft Notes from Michigan semi-annual call on 6/10

All—Below are my draft notes from our call last week, June 10, 2015. Thank you all for participating. Please feel free to edit as needed, to make sure I documented our discussion/agreements correctly.

Please see the red highlighted section—I need help on this one.

I only have written down 2 Action Items. Any I missed?

Please provide me changes/edits by Friday COB. Thank you!

Jen

Attendees:

MDEQ: Liane Shekter-Smith, Richard Benzie, Carrie Monosmith, Kris Philip, Dan Dettweiler, Marjorie Rodriguez-Student, Kevin Holdwick, Mike Prysby, Dana DeBruyn, Steve Busch

EPA Region 5: Tom Poy, Rita Bair, Nick Damato, Janet Kuefler, Michele Palmer, Tom Murphy, Heather Shoven, Cary McElhinney, Andrea Porter, Miguel Deltoral, Mostafa Noureldin

Summary:

1.Changes in Lead Disinvestments and Commitments for FY 2016 ARDP—for discussion: Due to our extreme focus on lead in drinking water, this is the consensus here.

d. Submittal of the lead and copper reporting form

(Suggested wording) MDEQ commits to requiring CWSs and NTNCWSs to submit the lead and copper reporting form via the annual monitoring letters to each system, tracking CWSs and NTNCWSs submittal of the lead and copper reporting form, and commits to issuing violations for failure to submit the lead and copper reporting form. The reporting form provides the address, description (, and specific location at NTNCWSs) of the sample site, designates sampling site selection criteria, and explanation(s) for any changes in sampling sites.

STATE: Dan Dettweiler stated that the NCWS program was not in a position to do this for the NTNCWSs at this time. Tom Murphy asked how does WaterTrack handle/track high lead results? Tom M said there is a truncation issue on the sample location name field—Dan acknowledged that this problem has been identified, and the Department of Technology Management and Budget (DTMB) has been trying to fix this problem, but it is a challenging problem. However, sample sites for NTNCWSs are identified by LHDs ~~The are actually identified by the LHDs~~ during the sanitary survey and are documented in the sanitary survey report. After NTNCWSs have a lead and/or copper action level exceedance (ALE), LHDs check ~~T~~the laboratory pdf results reports of the analyses which clearly states where the sample was taken, and recalculates the 90th percentile to verify the ALE thus, the oversight for the LCR is good .~~, and selects the sites for the NTNCWS systems;~~ But, Dan said the requirement to send in the lead and copper reporting form is not currently in the LHD annual monitoring letter sent to each system. The NTNCWSs do not couple this form to the Lead Consumer Notice, as does the CWSs. Kris Philip pointed out that the LHDs select the sample sites, thus when they are calculating the 90th percentile, they are actually double checking the sites with the results. However, Water Track only allows the calculation of a 90th percentile where, within a group of samples collected at a water system, at least one of the sample results exceeds the action level. Therefore, "In lieu of" requiring NTNCWS to submit a lead and copper reporting form, MDEQ also needs to begin flagging every NTNCWS sample Lead result above 15 ug/l ("and Cu result above 1.3 mg/l"). LHDs need to begin opening and reviewing each L/C sample result for these systems in WaterTrack (WT) and the laboratory pdf file report of the analysis to determine if it was taken from a valid sample site, instead of only reviewing the L/C sample summary page for the system, which does not include sample results.

Also, WT needs to re-programed or LHDs need to begin recalculating the 90th percentile correctly where less than 5 samples were collected and WT used the average of the two highest results instead of the highest result. (two examples R5 has noted are:

MI6120171, Sun Chemical Company

LHD should have reported a Lead 90th percentile value of 114 ug/l (highest of 4 sample results) instead of 84 ug/l for second half of 2011 (2009-2011 CP). System only collected 2 of 4 required L/C samples for 2012-2014 CP. LHD issued system an LCR M/R violation for 2012-2014 CP (and reported a Lead ALE for these samples in WT (90th percentile not provided by WT and not in SDWIS yet). LHD should report a Lead Lead 90th percentile of 25 ug/l, (highest of 2 sample results).

MI8020265, Coca Colo Refreshments

System's Lead ALEs for the first halves of 2012 and 2014 should have been reported with 90th percentile values equal to the highest Lead result of the 4 samples collected during these CPs: 122 ug/l (instead of 86.4 ug/l) for first half of 2012 and 21 ug/l (instead of of 19 ug/l) for the first half of 2014.

~~(I believe we concluded that at this time, the LHDs are actively reviewing the lead and copper results, and the sample locations as they were calculating the 90th percentiles; thus, these activities were acceptable at this time to meet this requirement. The Region would like to add that, at this time, this conclusion would be subject to State's annual audit reviews.)~~

Kris Philip said that the CWS program is requiring that the systems submit the form, but they are not enforcing whether or not the system submits the form. Often, the CWS will submit the Lead Consumer Notice and the Lead and Copper reporting form together. Kris said if 90%+ are already submitting the forms, then the State will agree to follow-up and enforce this requirement. But, if less than that, will probably be too much of a burden. Kris said they may change the way DEQ is tracking in SDWIS during FY 2016. But, the Region said SDWIS-Prime probably won't be available until 2017 at the earliest.

ACTION: Kris Philip will research with the District Offices to determine the current submittal rate of the lead and copper reporting form; and report back to the Region.

3. Status of Flint

a. TTHM levels for May—Due to MDEQ district engineer June 10-RECEIVED; see link to results

https://www.cityofflint.com/2015/06/01/may-water-testing-results-show-all-locations-are-within-acceptable-limits-for-tthm/

All samples below the TTHM MCL; one site still has an LRAA above the MCL but decreased from 105 ppb in Feb to 93.5 ppb in May.

Mike Prysby said he is getting ready to issue the construction permit to the City of Flint to install a GAC filter in July, that will remove more TOC to further reduce the potential of developing TTHMs. Mike said he has already issue a construction permit for a transmission line within the City that will help reduce water age.

b. Lead in Flint

Our discussions with MDEQ indicate that no phosphates/corrosion control has been added to the system since April 2014 when the source of drinking water changed to the Flint River. We understand that the City is just finishing up its second set of 6-month initial monitoring for lead; where the results will probably warrant a Corrosion Control Study to be conducted. Since Flint has lead service lines, we understand some citizen-requested lead sampling is exceeding the Action Level, and the source of drinking water will be changing again in 2016, so to start a Corrosion Control Study now doesn't make sense. The idea to ask Flint to simply add phosphate may be premature; there are many other issues and factors that must be taken into account which would require a comprehensive look at the water quality and the system before any treatment recommendations can/should be made. Miguel is recommending MDEQ and EPA? approach Flint about formally requesting EPA's Office of Research and Development in Cincinnati support on the lead in Flint drinking water issue, and request that Mike Schock, ORD, and possibly Darren Lytle, ORD, to participate in Flint's drinking water advisory committee so that a comprehensive evaluation on how to proceed can be discussed.

Miguel provided a brief summary of the high lead results found at the residence of Citizen name / Ex. 6 Citizen name / Ex. 6 in Flint. Miguel will follow up with a written summary of the work conducted, sample results, and conclusions.

Miguel believes that lead levels in Flint are being affected by the lack of Corrosion Control being conducted by the City, since the LCR requires 2 6-month initial monitoring for a new source. Steve Busch stated that in the Lead sampling pool, almost all of the lead sample sites are lead service lines, and the State is not seeing large increases in lead levels at the tap. Miguel suggested that EPA experts in Lead, Mike Schock; and in distribution systems, Darren Lytle, be added to the Flint drinking water advisory committee to assist the City/State in determining the best way to proceed to minimize lead in the City's drinking water during the interim use of the Flint River, and subsequent use of Lake Huron water.

Miguel said he will send Mike Schock and Darren Lytle's contact information to Steve and Mike. Steve pointed out that the City is following the LCR requirements, and completing the requirements in a timely manner. Miguel's point is that since the LCR was promulgated 20+ years ago, that research and different situations, like Washington D.C., have educated scientists, experts, and regulators that the existing requirements in the LCR may not be as protective as previously thought. Thus, he can only make recommendations as to how to revise sampling protocols. And Miguel acknowledges that it may be another year before these regulation changes are promulgated in the Long-Term Lead and Copper Rule. In December 2015, the NDWAC recommendation is expected.

The Region asked the State if the Flint River will be a permanent supplemental source of drinking water, once the City of Flint connects with the Karegdodi pipeline from Lake Huron. Mike Prysby said that the City is currently pumping 22MGD, but the City has 40-50 MG of storage. The City is currently working on reducing its unaccounted for water losses, and these water losses are dropping. The State, through the Governor's office, provided disadvantaged system funding, $2M which includes $900K for lead detection, and pipe inspection.

MEMORANDUM

SUBJECT: High Lead Levels in Flint, Michigan – Interim Report

FROM: Miguel A. Del Toral
Regulations Manager, Ground Water and Drinking Water Branch

TO: Thomas Poy
Chief, Ground Water and Drinking Water Branch

The purpose of this interim report is to summarize the available information regarding activities conducted to date in response to high lead levels in drinking water reported by a resident in the City of Flint, Michigan. The final report will be submitted once additional analyses have been completed on pipe and water samples.

Following a change in the water source, the City of Flint has experienced a number of water quality issues resulting in violations of National Primary Drinking Water Regulations (NPDWR) including acute and non-acute Coliform Maximum Contaminant Level (MCL) violations and Total Trihalomethanes (TTHM) MCL violations as follows:

Acute Coliform MCL violation in August 2014
Monthly Coliform MCL violation in August 2014
Monthly Coliform MCL violation in September 2014
Average TTHM MCL violation in December 2014
Average TTHM MCL violation in June 2015

In addition, as of April 30, 2014, when the City of Flint switched from purchasing finished water from the City of Detroit to using the Flint River as their new water source, the City of Flint is no longer providing corrosion control treatment for lead and copper.

A major concern from a public health standpoint is the absence of corrosion control treatment in the City of Flint for mitigating lead and copper levels in the drinking water. Recent drinking water sample results indicate the presence of high lead results in the drinking water, which is to be expected in a public water system that is not providing corrosion control treatment. The lack of any mitigating treatment for lead is of serious concern for residents that live in homes with lead service lines or partial lead service lines, which are common throughout the City of Flint.

In addition, following the switch to using the Flint River, the City of Flint began adding ferric chloride, a coagulant used to improve the removal of organic matter, as part of the strategy to reduce the TTHM levels. Studies have shown that an increase in the chloride-to-sulfate mass ratio in the water can adversely affect lead levels by increasing the galvanic corrosion of lead in the plumbing network.

Prior to April 30, 2014, the City of Flint purchased finished water from the City of Detroit which contained orthophosphate, a treatment chemical used to control lead and copper levels in the drinking water. When the City of Flint switched to the Flint River as their water source on April 30, 2014, the orthophosphate treatment for lead and copper control was not continued. In effect, the City of Flint stopped providing treatment used to mitigate lead and copper levels in the water. In accordance with the Lead and Copper Rule (LCR), all large systems (serving greater than 50,000 persons) are required to install and maintain corrosion control treatment for lead and copper. In the absence of any corrosion control treatment, lead levels in drinking water can be expected to increase.

The lack of mitigating treatment is especially concerning as the high lead levels will likely not be reflected in the City of Flint's compliance samples due to the sampling procedures used by the City of Flint for collecting compliance samples. The instructions from the City of Flint to residents direct the residents to 'pre-flush' the taps prior to collecting the compliance samples. A copy of the instructions provided by the City of Flint to residents will be included in the final report.

The practice of pre-flushing before collecting compliance samples has been shown to result in the minimization of lead capture and significant underestimation of lead levels in the drinking water. Although this practice is not specifically prohibited by the LCR, it negates the intent of the rule to collect compliance samples under 'worst-case' conditions, which is necessary for statistical validity given the small number of samples collected for lead and copper under the LCR. This is a serious concern as the compliance sampling results which are reported by the City of Flint to residents could provide a false sense of security to the residents of Flint regarding lead levels in the water and may result in residents not taking necessary precautions to protect their families from lead in the drinking water. Our concern regarding the inclusion of 'pre-flushing' in sampling instructions used by public water systems in Michigan has been raised with the Michigan Department of Environmental Quality (MDEQ). The MDEQ has indicated that this practice is not prohibited by the LCR and continues to retain the 'pre-flushing' recommendation in their lead compliance sampling guidance to public water systems in Michigan. A copy of the MDEQ guidance will be included in the final report.

In the case of the Flint resident that contacted U.S. EPA Citizen name / Ex. 6 the initial results from drinking water samples collected by the City of Flint in [redacted] home for lead were 104 ug/L and 397 ug/L. The level of iron in the water also exceeded the capability of the measurement (>3.3 mg/L). The lead results were especially alarming given that the samples were collected using the sampling procedures described above, which minimize the capture of lead. When contacted by U.S. EPA Region 5, the MDEQ indicated that the lead was coming from the [redacted] plumbing. [redacted] had previously indicated that all of the plumbing in the home was plastic.

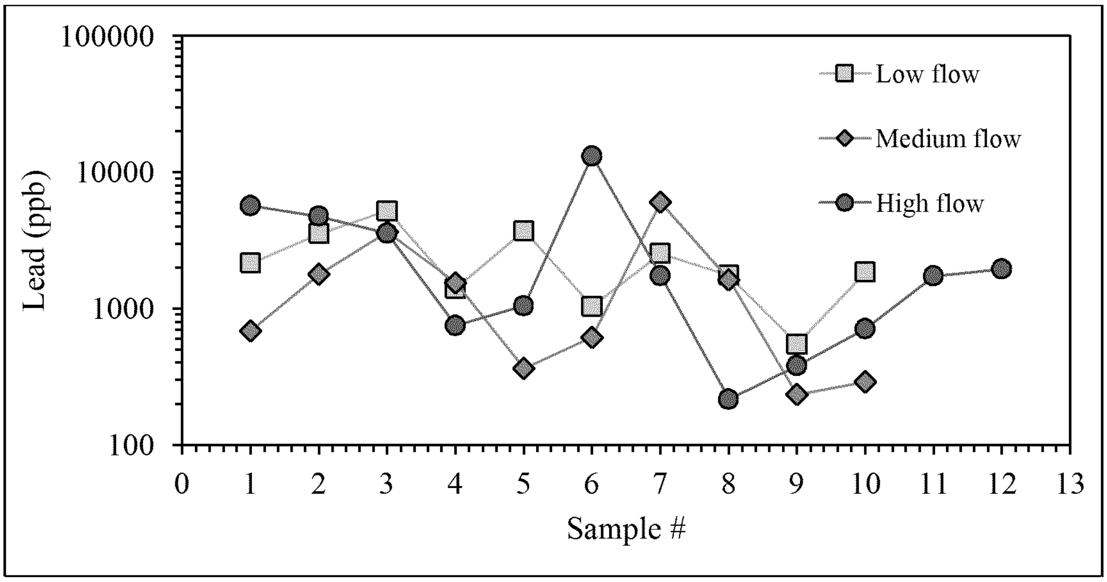
Following the confirmation of the initial high lead results, U.S. EPA Region 5 conducted two visits to the [redacted] home on April 27, 2015 and May 6, 2015. Based on an inspection of the plumbing and subsequent sampling conducted at the [redacted] residence, it was determined that except for a few minor metallic connectors, all interior plumbing, including the pipes, valves and connectors are made of plastic certified by the National Sanitation Foundation (NSF) for use in drinking water applications. Subsequent sampling showed that the faucets in the home appear to be compliant with the new lead-free requirements and are also not the source for the high lead levels. Our inspection of the interior plumbing and analysis of follow-up sampling results demonstrate that the home plumbing network is not the source of the high lead levels found at the [redacted] residence. The photographs and all sampling results will be included in the final report.

Based on the U.S. EPA inspection and documentation of the plastic plumbing at the [redacted] residence, it was suspected that the high lead was being introduced into the [redacted] home plumbing from outside the home, likely from a lead service line. Three portions of the service line were extracted during a subsequent trip on May 6, 2015 and sent for analysis, when the [redacted] service line was replaced. Analyses performed to date indicate that a portion of the service line is made of galvanized iron pipe. Inspection of the remaining portion from the water main to the external shut-off valve confirmed that the portion from the water main to the external shut-off valve is a lead service line.

[redacted] has also provided U.S. EPA with medical reports on her child's blood lead testing indicating that the child had a low blood lead level (2 ug/dL) prior to the source water switch and an elevated blood lead level following the switch (6.5 ug/dL). Redacted copies of these reports will also be included in the final report.

Subsequent to the discovery of high lead levels in the [redacted] drinking water, the water to the [redacted] home was shut off on April 3, 2015. The water was briefly turned back on to collect additional samples on April 28, 2015. Since the water had stagnated for an extended period of time, the kitchen tap was flushed for 25 minutes the night before collecting the samples. Three sets of samples were collected at different flow rates (10 at low flow, 10 at medium flow and 10 at high flow).

The drinking water samples collected from the Citizen name / Ex. 6 esidence on April 28, 2015 contained extremely high lead levels, ranging in value from 200 ug/L to 13,200 ug/L (see below).



Sample results and graph are provided courtesy of Virginia Tech

Additional sample results from resident-requested samples have also shown lead levels in excess of the lead action level. As with the samples collected by the City of Flint for compliance, the resident-requested samples are also being collected using the ‘pre-flushing’, so the lead levels captured in these samples likely do not represent the worst-case lead levels in the water and the actual lead levels at these homes may be much higher.

Pending completion of the final report, my interim recommendations are as follows:

1. The U.S. EPA should follow up with the MDEQ and the City of Flint on the recommendation made by U.S. EPA to MDEQ on June 10, 2015 to offer the City of Flint technical assistance on managing the different water quality issues in Flint, including lead in the drinking water. Although there have been two written assessments regarding water quality and operational issues in Flint at the time of this report, they do not address lead in drinking water. The first is an Operational Evaluation Report (OER) produced in November 2014 by Lockwood, Andrews and Newnam, Inc. to assess the factors contributing to high Total Trihalomethane (TTHM) levels in Flint following the source change. The focus of this report is to identify potential causes and remedial actions for lowering TTHM levels. The second report (Water Quality Report) produced by Veolia for the City of Flint on March 12, 2015, is an assessment of Flint’s water quality and operations which provides advice to the City of Flint primarily focused on TTHM control and other operational issues. Both reports were written prior to the recent discovery of high lead results in Flint drinking water. As such, the reports do not take into account the potential effects on lead levels in drinking water.

As previously mentioned, the City of Flint currently has no mitigating treatment for lead and is also planning another source water change in the near future. U.S. EPA's Office of Research and Development in Cincinnati has extensive experience in corrosion and corrosion control treatment and distribution system issues and would be a valuable addition to the drinking water advisory group for the City of Flint. Copies of the qualifications and experience for Michael Schock and Darren Lytle have been forwarded to MDEQ.

2. U.S. EPA should review the compliance status of the City of Flint with respect to whether the system is in violation of the LCR requirement to install and maintain optimal corrosion control and whether the MDEQ is properly implementing the LCR provisions regarding optimal corrosion control treatment requirements for large systems. Pursuant to 40 CFR Section 141.82(i), the EPA Regional Administrator may review treatment determinations made by a State and issue federal treatment determinations consistent with the requirements of the LCR where the Regional Administrator finds: (1) A state has failed to issue a treatment determination by the applicable deadlines; (2) A State has abused its discretion in a substantial number of cases or in cases affecting a substantial population; or (3) The technical aspects of a State's determination would be indefensible in an expected Federal enforcement action taken against a system.

3. The U.S. EPA should review whether relevant resident-requested samples are being included by the City of Flint in calculating the 90th percentile compliance value for lead. Recent drinking water tests conducted at homes in Flint for lead that are not part of the compliance sampling pool have revealed high lead levels in the drinking water. The U.S. EPA memorandum signed on December 23, 2004 provides clarification on compliance determinations and states that customer-requested samples are to be included in the 90th percentile lead compliance calculation where the sampling is conducted during the monitoring period from sites and sampling procedures meeting the LCR criteria. Given the prevalence of lead service lines in the City of Flint, should these sample results be from homes with lead service lines, the sample results would be considered compliance samples under the LCR.

Also attached is a timeline of events for Flint, Michigan. Should you have any questions regarding the information or recommendations provided, please let me know.

Thank you for the kind words. I am paid by everyone's tax dollars to do my job, which is to ensure that public health is protected and I try my best to do that. I think it's critical for public officials and the general public to engage in a constructive and transparent manner,.

Regarding the report, I have unfortunately not had time to complete the final report yet but I am going to be working to complete the final report as soon as possible and will send you a copy when it is complete. In the meantime, I actually just finished the interim report today, so I am attaching that.

Thank you for your patience.

Respectfully,

Subject: RE: Interim Report on High Lead Levels in Flint

I have a few questions after reading the interim report. We are briefing Tinka this afternoon and having answers to these questions to the extent you can will be helpful. Thanks.

1. Page 1 "Recent drinking water sample results indicate the presence of high lead results in the drinking water" – How many homes? What data do we have to support this statement? From what you have in the report, it appears we have three homes [redacted] Personal Address / Ex. 6 last measured at 22 ug/l except for the residual in the water heater; [redacted] Personal Address / Ex. 6 last measured at 22 ug/l; and [redacted] Personal Address / Ex. 6 last measured at 42 ug/l. What other data do we have to say this is wide-spread?

2. Pg 3, "Following the confirmation of the initial high lead results, USEPA Region 5 conducted two site visits" – I think we need a footnote that explains our rationale for why we went out there. What I remember Tom saying is that it was for the science and data that was available and could uniquely inform the NDWAC discussions. Does this sound right or could you provide more background on why?

3. Pg 5, "Copies of the qualifications and experience for Michael Schock and Darren Lytle have been forwarded to MDEQ". I will ask Jen to find out if MDEQ has shared this with Flint yet. If they have, I think we should say that it has been shared with Flint in the final report.

4. Pg 5, "#3 – Recent drinking water tests conducted at homes in Flint for lead that are not part of the compliance sampling pool have revealed high lead levels in the drinking water". Where did we get this data from? We may want to reference that in the report.

5. Timeline #18 – you mention the Water Quality Report done by Veolia "Primarily focused on lowering TTHM". Was there anything in the report about lead?

6. Timeline #19 – No sources of lead found in the home… Have we communicated what we found – all plastic pipes – with MDEQ?

Attached is the interim report on the high lead levels in Flint, Michigan. Sorry to take so long on this. I am working as fast as I can on the final report. I am waiting on some additional information from Marc Edwards before I can finish the final report. The first doc is the signed memo with the external 'cc' folks. The second is the internal copy with the 'bcc' list and the third doc is the timeline of events up to date on the Flint water quality.

Subject: RE: Interim Report on High Lead Levels in Flint

I have a few questions after reading the interim report. We are briefing Tinka this afternoon and having answers to these questions to the extent you can will be helpful. Thanks.

1. Page 1 "Recent drinking water sample results indicate the presence of high lead results in the drinking water" – How many homes? What data do we have to support this statement? From what you have in the report, it appears we have three homes Personal Address / Ex. 6 last measured at 22 ug/l except for the residual in the water heater; Personal Address / Ex. 6 last measured at 22 ug/l; and Personal Address / Ex. 6 last measured at 42 ug/l. What other data do we have to say this is wide-spread?

MDT: The following homes that we know of have had sample results above the lead action level using first-draw samples, pre-flushed the night before for 3-4 minutes, and a limit on stagnation time of 6-8 hours:

Personal Address / Ex. 6

Personal Address / Ex. 6

Personal Address / Ex. 6

The samples from Personal Address / Ex. 6 are N/A as they are from sequential sampling, and the water heater samples were from [redacted] Personal Address / Ex. 6 home at Personal Address / Ex. 6 not Personal Address / Ex. 6 and are also N/A, with respect to first-draw samples.

[The following rant is not directed at you]

The widespread high lead is my judgement based on a couple of decades of working with lead issues and I stand by it despite the limited data set from Flint. A simple application of scientific principles to the circumstances in Flint along with the limited data are enough to know that there is a problem there. They have had no corrosion control treatment in place for over a year now and they have lead service lines. It's just basic chemistry on lead solubility. You will have high lead leaching into the water where you are doing nothing to mitigate that. We don't need to drop a bowling ball off every building in every town to know that it will fall to the ground in all of these places. The fact that their sampling is designed not to capture lead (everything is fine) does not negate our scientific understanding of what is going on. The only reason we don't have more data is because the City of Flint is flushing away the evidence before measuring for it. They use pre-flushing and they limit the stagnation time to between 6-8 hours. A copy of the Flint sampling instructions is attached. A 3-4 minute flush in most cases would easily flush all of the lead away at most homes and since the lead portions of the service lines are mainly from the water main to the external shut-off valve, there is zero chance or close to zero chance that you will ever capture any of the high lead that dissolves within the lead service line in a one liter sample from the kitchen tap because the tap is too far away from the high lead sitting in the lead service line. Since the water hasn't be used in the home, the high lead hasn't moved toward the home because residents are told not to use the water after they pre-flush. The high lead levels we are seeing in Flint are mainly particulate lead, which is released sporadically in most cases, so unfortunately for Flint in their attempts to avoid capturing lead, these particles are being captured despite their attempts not to capture lead.

I understand that this is not a comfortable situation, but the State is complicit in this and the public has a right to know what they are doing because it is their children that are being harmed. At a MINIMUM, the City should be warning residents about the high lead, not hiding it telling them that there is no lead in teh water. To me that borders on criminal neglect. The only people that question the science are the ones that have a vested interest in not finding lead. When we look, we find it. When they look, they either don't find it or if they find it, they dismiss it as the resident's plumbing or use some other fabricated reason.

If there truly is a question in anyone's mind that there is a widespread lead problem in Flint, despite the painfully clear science, I am requesting that I be provided two assistants and that you folks allow me go and sample 100 homes in Flint without the pre-flushing and then we can satisfy any doubts that anyone may have. I am not even asking for per diem and I'll pay my own hotel.

Sorry for the rant, but I am really getting tired of the bad acfors being defended, the bad actions being ignored, and people trying to do the right thing are constantly being subjected to intense scrutinty as if we were doing something wrong. It's all of this 'don't find anything bad' crap at EPA that is reason I desparately want to leave. I am not happy to find bad things. It is completely stressful because it means children are being damaged and I have to put up with all of the political crap, but where these problems exist I will not ignore them. I truly, truly hate working here. EPA is a cesspool.

2. Pg 3, "Following the confirmation of the initial high lead results, USEPA Region 5 conducted two site visits" – I think we need a footnote that explains our rationale for why we went out there. What I remember Tom saying is that it was for the science and data that was available and could uniquely inform the NDWAC discussions. Does this sound right or could you provide more background on why?

There were actually two reasons. The first was to better understand what was going on in Flint for possible use at the NDWAC meetings and ultimately to inform the LCR rulemaking. The second was that I knew they were pre-flushing and I knew, based on the information that Personal Address / Ex. 6 provided, that the State was either lying or was misinformed about the source of her high lead.

3. Pg 5, "Copies of the qualifications and experience for Michael Schock and Darren Lytle have been forwarded to MDEQ". I will ask Jen to find out if MDEQ has shared this with Flint yet. If they have, I think we should say that it has been shared with Flint in the final report.

Yes, if Jen can give me a date when MDEQ asked Flint, I will include that in the timeline/final report. Ultimately, it's up to Flint as to whether they want to accept the offer or not.

4. Pg 5, "#3 – Recent drinking water tests conducted at homes in Flint for lead that are not part of the compliance sampling pool have revealed high lead levels in the drinking water". Where did we get this data from? We may want to reference that in the report.

Personal Address / Ex. 6 in response to her high lead found in her water was being a good neighbor and informed neighbors and friends who then requested that the City test their water.

5. Timeline #18 – you mention the Water Quality Report done by Veolia "Primarily focused on lowering TTHM". Was there anything in the report about lead?

No. There was nothing on lead at all in the report. The high lead levels were not known at the time that report was written. They did make some operational recommendations as well, but they were geared toward TTHM compliance. They did recommend adding polyphoshate, but that does nothing to control lead. It was recommended for sequestering the iron, due to the complaints about the discolored water.

6. Timeline #19 – No sources of lead found in the home… Have we communicated what we found – all plastic pipes – with MDEQ?

I am pretty I did, but everything has been a blur for the past couple of months so I can't definitely say that I did.

Subject: RE: Interim Report on High Lead Levels in Flint --> is the recent violation history complete?

Hi Heather and Jen,

In Miguel's Flint Interim Report (see email below), he includes a list of recent violations, as follows:

Acute Coliform MCL violation in August 2014

Monthly Coliform MCL violation in August 2014

Monthly Coliform MCL violation in September 2014

Average TTHM MCL violation in December 2014

Average TTHM MCL violation in June 2015

Is the violation list complete? There could there be other newer violations (anything after December 31, 2014) at Flint that haven't yet been reported to SDWIS/FED.

For example, the violation from June 2015 won't show up in SDWIS/FED until the October 2015 data freeze. I know the State shared the violation letter with Jen, so we were aware of it ahead of the submission of the data to SDWIS/FED. Was there another TTHM violation between the December 2014 and June 2015 violations (I would have expected one since the violation is based on LRAA)? If so, it wouldn't show up in SDWIS/FED until the July 2015 freeze.

How should this be handled for Miguel's list? Do we need to add any explanations?

Thanks,

Andrea Porter

City of Flint VN - MCL TTHM 12_16_14.pdf

Hi Andrea,

Good catch.

Based on the attached 3 NOV letters received from MDEQ, I would characterize the TTHM MCL Violations in the following manner –

Average TTHM MCL violation in December 2014 for Q4 2014

Average TTHM MCL violation in March 2015 for Q1 2015

Average TTHM MCL violation in June 2015 for Q2 2015

Best wishes,

Heather

STATE OF MICHIGAN
DEPARTMENT OF ENVIRONMENTAL QUALITY
LANSING DISTRICT OFFICE

RICK SNYDER
GOVERNOR

DAN WYANT
DIRECTOR

March 5, 2015

Mr. Brent Wright, Operations Supervisor
City Of Flint - DPW
Flint Water Plant
4500 North Dort Highway
Flint, Michigan 48505

WSSN: 02310

Dear Mr. Wright:

SUBJECT: Violation Notice (VN) – Maximum Contaminant Level for Total Trihalomethanes (TTHM)
Operational Evaluation – Total Trihalomethanes
1st Quarter 2015 Monitoring Period

The Department of Environmental Quality (DEQ), Office of Drinking Water and Municipal Assistance (ODWMA), records show that the city of Flint (City) is in violation of the Safe Drinking Water Act,1976 PA 399, as amended (Act 399); R 325.10610, *Maximum contaminant levels for disinfection byproducts (MCLs)*, of the 1979 Administrative Code.

In accordance with R 325.10610, *MCLs*, of the 1979 Administrative Code, the MCL for disinfection byproduct TTHM is 0.080 milligrams per liter (mg/L) as a Locational Running Annual Average (LRAA) at each monitoring location. As listed in the table below, our records show that the City's highest TTHM locational running annual average (LRAA), based on the last four quarters, ending February 28, 2015, is 0.105 mg/L which exceeds the standard, and that two of the eight sample site locations exceed the standard of 0.080 mg/L.

Further, in accordance with R 325.10719l, *Disinfection byproducts: operational evaluation levels*, of the 1979 Administrative Code, when an operational evaluation level (OEL) at a monitoring location for TTHM exceeds 0.080 mg/L, a supply shall conduct an operational evaluation and submit a written report of the evaluation to the DEQ not later than 90 days after being notified of the analytical result that causes the supply to exceed the operational evaluation level. As listed in the table below, our records show that the TTHM OELs for the City exceed 0.080 mg/L at one of the City's eight sample site locations.

TTHM Results (mg/L)						
	5/21/14	8/21/14	11/20/14	2/17/15	LRAA	OEL
DBP1 McDonalds 3719 Davison	**0.162**	**0.145**	0.059	0.0162	**0.096**	0.059
DBP2 Liquor Palace 3302 S. Dort Highway	**0.112**	**0.127**	0.033	0.0168	0.072	0.049
DBP3 North Flint Auto 6204 N. Saginaw St.	**0.097**	**0.118**	0.041	0.0149	0.068	0.047
DBP4 University Market 2501 Flushing Road	**0.106**	**0.196**	**0.094**	0.0245	**0.105**	**0.085**
DBP5 Taco Bell 3606 Corunna Road	0.079	**0.181**	0.034	0.0151	0.078	0.063
DBP6 Rite-Aid Pharmacy 5018 Clio Road	**0.088**	**0.144**	0.054	0.0192	0.076	0.059
DBP7 Salem Housing 3216 MLK Boulevard	**0.082**	**0.112**	0.050	0.0285	0.068	0.055
DBP8 BP Gas Station 822 S. Dort Highway	0.075	**0.112**	0.036	0.0199	0.061	0.047

Our investigation consisted of a review of ODWMA files for laboratory reports received for compliance monitoring. Our investigation is considered complete. This violation began on March 1, 2015, and will continue until TTHM LRAA is below the MCL at all sample sites.

We are encouraged by the results from the most recent round of compliance samples collected on February 17, 2015, which now show individual TTHM levels at less than half of the 0.080 mg/L standard at all locations throughout the City's system. Operational Evaluation Reports from December 2014, and February 2015, have identified possible causes and corrective measures for the previous elevated TTHM levels which we encourage the City to continue implementing. These modifications have likely contributed in part to the reduction in TTHM levels reported in the most recent quarter, and suggest the City may be able to achieve compliance with the TTHM standard at all sites by continuing these efforts.

Our office is currently reviewing the Operational Evaluation Report dated February 27, 2015, and will provide the City and their consultant with comments, as needed, to help address this MCL violation.

Water systems that exceed the OEL must complete and submit an Operational Evaluation in accordance with Administrative Rule 719l (R 325.10719l) within 90 days of being notified of the violation. **An updated Operational Evaluation report, which incorporates the most recent sample results, must now be completed and received by our office by no later than Friday, May 29, 2015**.

If you have any other factual information you would like us to consider regarding the violation identified in this VN, please provide them in a written response by March 19, 2015.

Administrative rule R 325.10403 of Act 399 requires that suppliers provide public notice (PN) as soon as practical, but no later than thirty (30) days after the supplier learns of this type of violation, by mail or direct delivery **and** by any other means reasonably calculated to reach customers not normally reached by mail. Enclosed is a sample PN which contains the minimum required language. The City is encouraged to include additional information regarding its response efforts to this violation. **Please notify your consumers by April 1, 2015, and send us a signed and dated copy of the notice that you issued within ten (10) days of distributing the public notice**. This violation must also be included in your 2015 Consumer Confidence Report, due by July 1, 2016. The PN must be repeated every quarter until you no longer exceed the TTHM standard. Failure to issue a PN for this violation will result in a fine of at least $1,000 per event, with a maximum of $5,000 per violation.

We anticipate and appreciate your continued cooperation in resolving this matter. If you have any questions regarding this VN, please contact us at the numbers below; at prysbym@michigan.gov; or rosenthala@michigan.gov; or at DEQ, P.O. Box 30242, Lansing, Michigan 48909-7742.

Sincerely,

Michael Prysby

Mr. Stephen Busch, DEQ

IMPORTANT INFORMATION ABOUT YOUR DRINKING WATER

City of Flint Did Not Meet Treatment Requirements

Our water system recently violated a drinking water standard. Although this incident was not an emergency, as our customers, you have a right to know what happened and what we are doing to correct this situation.

We routinely monitor for the presence of drinking water contaminants. Samples were collected for total trihalomethanes (TTHM) analysis from eight locations on a quarterly basis (May 21, August 21, November 20 of 2014, and February 17, 2015). The average of the results at **ANY** of the eight locations must not exceed the maximum contaminant level (MCL) for TTHMs, otherwise our water system exceeds the MCL. The standard for TTHMs is 80 micro grams per liter (µg/L). The location reporting the highest TTHM level was 105 ug/L; thus, our water system exceeds the TTHM MCL.

What should I do?

- There is nothing you need to do unless you have a severely compromised immune system, have an infant, or are elderly. These people may be at increased risk and should seek advice about drinking water from their health care providers.
- You do not need to boil your water or take other corrective actions. If a situation arises where the water is no longer safe to drink, you will be notified within 24 hours.

What does this mean?

This is not an emergency. If it had been an emergency, you would have been notified within 24 hours.

People who drink water containing trihalomethanes in excess of the MCL over many years may experience problems with their liver, kidneys, or central nervous system, and may have an increased risk of getting cancer.

What is being done?

We are currently working on solutions to correct the problem. We anticipate resolving the problem in 2015. Our most recent individual sample results were all less than half the 80 µg/L standard, however since compliance is calculated using a locational running annual average (LRAA) of the most recent four quarters, we are still out of compliance with the MCL at two of eight locations.

For more information, please contact Mr. Brent Wright at 517-787-6537, or the Flint Water Plant at 4500 North Dort Highway, Flint, Michigan 48505.

Please share this information with all the other people who drink this water, especially those who may not have received this notice directly (for example, people in apartments, nursing homes, schools, and businesses). You can do this by posting this notice in a public place or distributing copies by hand or mail.

This notice is being sent to you by the City of Flint.

CERTIFICATION: WSSN: 02310

I certify that this water supply has fully complied with the public notification requirements in the Michigan Safe Drinking Water Act, 1976 PA 399, as amended, and the administrative rules.

Signature	Title	Date Distributed

Reminder to water supplier: This notice/certification must be sent to the Department of Environmental Quality.

Subject: RE: Interim Report on High Lead Levels in Flint

Miguel—I understand your desire to prove to MDEQ that there pre-flushing protocol is minimizing the levels of lead. I also understand the need the determine unequivocally via sampling, the *actual* levels of lead in Flint drinking water. Your proposal to take 100 lead samples at homes in Flint w/lead service lines, and w/o the pre-flushing protocol is a good one, if we can get the approvals to do it. I would be happy to help you with that sampling effort, Miguel, and pay my own travel expenses too. I'm wondering if we could get Mike Schock to help with the planning for the sampling; our sampling protocol and locations of samples, etc.

Also, I discussed this with Janet this morning, and she suggested a Blood Lead Level Study, like what was done in D.C., in 2005. Who would undertake a study like this in Flint? Wouldn't this be a more definitive indication that there is a lead problem in Flint?

I know that MDEQ does not think there is a lead issue in Flint. And we may not be able to convince them that there is lead issue unless we have black and white laboratory results to prove it. However, MDEQ—Pat Cook, said to me in mid-May, that since Flint has not been adding phosphates since April 2014, that maybe Flint should be adding corrosion control/phosphates of some sort, to protect against corrosion/lead leeching since the phosphate scale from the Detroit days is probably gone—a preventative precautionary statement, I think. Miguel, I know you disagree with Flint just adding phosphates w/o any study on what type of corr control, concentrations to add, etc., but perhaps this admission by Pat Cook might be the way to negotiate a compromise for the State to request Flint to do public education on a mass scale to educate the people on how long to flush their water before using in the morning or if it had been stagnant for a given amount of time.

Yes, I have forwarded the bios for Mike Schock and Darren Lytle to MDEQ; haven't heard back from them whether they shared with Flint (I sent Steve B and Mike P an email Friday 6/26). I also email Mike Wright/ORD as to whether he was aware if MDEQ had shared their bios with Flint.

Regarding your question #6, Rita: I also had conversations with Pat Cook and Mike Prysby at MDEQ about Citizen name / Ex. 6 indoor plastic piping, but I did not clearly state in any email that Citizen name / Ex. 6 Citizen name / Ex. 6 plumbing was proven to be all plastic—I alluded to it in one of my emails to Steve and Mike.

Subject: RE: Interim Report on High Lead Levels in Flint

I have a few questions after reading the interim report. We are briefing Tinka this afternoon and having answers to these questions to the extent you can will be helpful. Thanks.

1. Page 1 "Recent drinking water sample results indicate the presence of high lead results in the drinking water" – How many homes? What data do we have to support this statement? From what you have in the report, it appears we have three homes Citizen name / Ex. 6 ast measured at 22 ug/l except for the residual in the water heater; Citizen name / Ex. 6 ast measured at 22 ug/l; and Citizen name / Ex. 6 last measured at 42 ug/l. What other data do we have to say this is wide-spread?

MDT: The following homes that we know of have had sample results above the lead action level using first-draw samples, pre-flushed the night before for 3-4 minutes, and a limit on stagnation time of 6-8 hours:

Personal Address / Ex. 6

Personal Address / Ex. 6

Personal Address / Ex. 6

The samples from Personal Address / Ex. 6 are N/A as they are from sequential sampling, and the water heater samples were from Citizen name / Ex. 6 home a Personal Address / Ex. 6, not Personal Address / Ex. 6 and are also N/A, with respect to first-draw samples.

[The following rant is not directed at you]

The widespread high lead is my judgement based on a couple of decades of working with lead issues and I stand by it despite the limited data set from Flint. A simple application of scientific principles to the circumstances in Flint along with the limited data are enough to know that there is a problem there. They have had no corrosion control treatment in place for over a year now and they have lead service lines. It's just basic chemistry on lead solubility. You will have high lead leaching into the water where you are doing nothing to mitigate that. We don't need to drop a bowling ball off every building in every town to know that it will fall to the ground in all of these places. The fact that their sampling is designed not to capture lead (everything is fine) does not negate our scientific understanding of what is going on. The only reason we don't have more data is because the City of Flint is flushing away the evidence before measuring for it. They use pre-flushing and they limit the stagnation time to between 6-8 hours. A copy of the Flint sampling instructions is attached. A 3-4 minute flush in most cases would easily flush all of the lead away at most homes and since the lead portions of the service lines are mainly from the water main to the external shut-off valve, there is zero chance or close to zero chance that you will ever capture any of the high lead that dissolves within the lead service line in a one liter sample from the kitchen tap because the tap is too far away from the high lead sitting in the lead service line. Since the water hasn't be used in the home, the high lead hasn't moved toward the home because residents are told not to use the water after they pre-flush. The high lead levels we are seeing in Flint are mainly particulate lead, which is released sporadically in most cases, so unfortunately for Flint in their attempts to avoid capturing lead, these particles are being captured despite their attempts not to capture lead.

I understand that this is not a comfortable situation, but the State is complicit in this and the public has a right to know what they are doing because it is their children that are being harmed.

At a MINIMUM, the City should be warning residents about the high lead, not hiding it telling them that there is no lead in teh water. To me that borders on criminal neglect. The only people that question the science are the ones that have a vested interest in not finding lead. When we look, we find it. When they look, they either don't find it or if they find it, they dismiss it as the resident's plumbing or use some other fabricated reason.

If there truly is a question in anyone's mind that there is a widespread lead problem in Flint, despite the painfully clear science, I am requesting that I be provided two assistants and that you folks allow me go and sample 100 homes in Flint without the pre-flushing and then we can satisfy any doubts that anyone may have. I am not even asking for per diem and I'll pay my own hotel.

Sorry for the rant, but I am really getting tired of the bad acfors being defended, the bad actions being ignored, and people trying to do the right thing are constantly being subjected to intense scrutinty as if we were doing something wrong. It's all of this 'don't find anything bad' crap at EPA that is reason I desparately want to leave. I am not happy to find bad things. It is completely stressful because it means children are being damaged and I have to put up with all of the political crap, but where these problems exist I will not ignore them. I truly, truly hate working here. EPA is a cesspool.

2. Pg 3, "Following the confirmation of the initial high lead results, USEPA Region 5 conducted two site visits" – I think we need a footnote that explains our rationale for why we went out there. What I remember Tom saying is that it was for the science and data that was available and could uniquely inform the NDWAC discussions. Does this sound right or could you provide more background on why?

There were actually two reasons. The first was to better understand what was going on in Flint for possible use at the NDWAC meetings and ultimately to inform the LCR rulemaking. The second was that I knew they were pre-flushing and I knew, based on the information that Citizen name / Ex. 6 Citizen name / Ex. 6 provided, that the State was either lying or was misinformed about the source of her high lead.

3. Pg 5, "Copies of the qualifications and experience for Michael Schock and Darren Lytle have been forwarded to MDEQ". I will ask Jen to find out if MDEQ has shared this with Flint yet. If they have, I think we should say that it has been shared with Flint in the final report.

Yes, if Jen can give me a date when MDEQ asked Flint, I will include that in the timeline/final report. Ultimately, it's up to Flint as to whether they want to accept the offer or not.

4. Pg 5, "#3 – Recent drinking water tests conducted at homes in Flint for lead that are not part of the compliance sampling pool have revealed high lead levels in the drinking water". Where did we get this data from? We may want to reference that in the report.

Citizen name / Ex. 6 in response to her high lead found in her water was being a good neighbor and informed neighbors and friends who then requested that the City test their water.

5. Timeline #18 – you mention the Water Quality Report done by Veolia "Primarily focused on lowering TTHM". Was there anything in the report about lead?

No. There was nothing on lead at all in the report. The high lead levels were not known at the time that report was written. They did make some operational recommendations as well, but they were geared toward TTHM compliance. They did recommend adding polyphoshate, but that does nothing to control lead. It was recommended for sequestering the iron, due to the complaints about the discolored water.

6. Timeline #19 – No sources of lead found in the home… Have we communicated what we found – all plastic pipes – with MDEQ?

I am pretty I did, but everything has been a blur for the past couple of months so I can't definitely say that I did.

Subject: Interim Report on High Lead Levels in Flint
Importance: High

Attached is the interim report on the high lead levels in Flint, Michigan. Sorry to take so long on this. I am working as fast as I can on the final report. I am waiting on some additional information from Marc Edwards before I can finish the final report. The first doc is the signed memo with the external 'cc' folks. The second is the internal copy with the 'bcc' list and the third doc is the timeline of events up to date on the Flint water quality.

Thanks Miguel - we are submitting the revised guidance manual tomorrow afternoon, so if we don't get chance to talk, we can connect after you have reviewed the changes. One thing for you to look at tomorrow if you have time is proposed text for a new text box on Pb(IV) below.

Thanks!

Laura

Office: 703.247.6152

Cell: 703.862.0760

Important Questions about Pb(IV)

Do my lead service lines have Pb(IV) scales?

Pb(IV) (also known as Lead IV or Pb^{++}) can occur on any lead surface. It forms under highly oxidative conditions. If you have lead service lines with a moderate pH (7 – 8), a consistent free chlorine residual throughout the system (typically 1 – 2 mg/L or higher), and no lead problems, you might have predominantly Pb(IV) scales. To help determine if your systems is a candidate for Pb(IV) scales, you can measure ORP of the water – Eh values of 0.7 volts or higher are indicative of Pb(IV) scales. You can also evaluate the scale on exhumed lead service lines to find out for sure.

Can I promote formation of Pb(IV) scales to reduce lead levels?

Although some utilities are targeting the development of a PB(IV) scale in their systems to control lead release (Brown et al. 2013), questions remain as to how systems and primacy agencies can ensure that disinfectant residuals required for the formation and maintenance of PbO_2 scales are maintained within lead service lines throughout the distribution system and to the customer's taps. This may be a particular challenge with homes that go unoccupied for an extended period of time. Therefore, EPA has not included formation of a Pb(IV) scale as a corrosion control treatment technique in this document at this time.

What happens if I have Pb(IV) scales and I change treatment?

Changing disinfectant from free chlorine to chloramine for disinfection may destabilize Pb(IV) scales.

Systems can use other corrosion control treatments such as pH/alkalinity/DIC adjustment or phosphate-based corrosion inhibitors, but lead levels may increase as the scale is converting from Pb(IV) to Pb(II) based scale.

Hi Miguel - good luck on everything, and if today doesn't work how about Monday? Monday is actually a little better for me, my schedule is open from 9:30 - 4:30 Eastern.

Thanks!

Laura

Hi Laura,

I did not make the trip. I have an urgent report on Flint MI that I have to finish up. I am hoping to have that done by Friday, but stuff is always coming up. I will keep you posted on availability for Friday.

Hi Miguel! I realized I should have asked a long time ago, but will you be here in Arlington for the final LCR WG meeting? I was hoping we could meet for 1/2 hour to an hour to talk about monitoring recommendations in the manual. If you are not in DC maybe we can talk by phone by Friday?

Thanks!

Laura

Attached are all of the combined graphs from the study. I think the Site 1 graph would be good. There was 8 ft of copper pipe from the ktichen tap to the meter/LSL and an 89 ft LSL following that. If you want to use a different one, let me know and I will send the plumbing info to you.

Sorry for the multiple e-mails but one more thought, do you happen to have a good sample premise plumbing profile graph that we can use for the guidance manual? The one there now is from the AWWA 2011 internal corrosion book from DCWater (see below), but we were hoping for an original from you or Mike.

Thanks Miguel!

Thanks Miguel - we are submitting the revised guidance manual tomorrow afternoon, so if we don't get chance to talk, we can connect after you have reviewed the changes. One thing for you to look at tomorrow if you have time is proposed text for a new text box on Pb(IV) below.

Thanks!

Laura

Office: 703.247.6152

Cell: 703.862.0760

Important Questions about Pb(IV)

Do my lead service lines have Pb(IV) scales?

Pb(IV) (also known as Lead IV or Pb++) can occur on any lead surface. It forms under highly oxidative conditions. If you have lead service lines with a moderate pH (7 – 8), a consistent free chlorine residual throughout the system (typically 1 – 2 mg/L or higher), and no lead problems, you might have predominantly Pb(IV) scales. To help determine if your systems is a candidate for Pb(IV) scales, you can measure ORP of the water – Eh values of 0.7 volts or higher are indicative of Pb(IV) scales. You can also evaluate the scale on exhumed lead service lines to find out for sure.

Can I promote formation of Pb(IV) scales to reduce lead levels?

Although some utilities are targeting the development of a PB(IV) scale in their systems to control lead release (Brown et al. 2013), questions remain as to how systems and primacy agencies can ensure that disinfectant residuals required for the formation and maintenance of PbO2 scales are maintained within lead service lines throughout the distribution system and to the customer's taps. This may be a particular challenge with homes that go unoccupied for an extended period of time. Therefore, EPA has not included formation of a Pb(IV) scale as a corrosion control treatment technique in this document at this time.
What happens if I have Pb(IV) scales and I change treatment?
Changing disinfectant from free chlorine to chloramine for disinfection may destabilize Pb(IV) scales. Systems can use other corrosion control treatments such as pH/alkalinity/DIC adjustment or phosphate-based corrosion inhibitors, but lead levels may increase as the scale is converting from Pb(IV) to Pb(II) based scale.

I finished my interim report on Flint, but I was out Thursday afternoon and all day Friday when I was going to work on some RTCR stuff. So now I have to complete my RTCR review for IL DPH today. I will let you know when I get that done and barring any more firedrills, we can hope set something up in the next day or so.

Dr. Hedman,
Please take a look at the communication I received from the City of Flint Public Information Officer about comments that may have been made about Flint Water from an EPA region 5 staff.

It would be helpful for me to have the same information that was shared with the ACLU representative if indeed this is what took place. I will also be following up with the City of Flint DPW Director Howard Croft to see if he has received this information already or not.

We certainly want to work to address any concerns that have arisen as the City's water treatment, distribution system, and testing processes have been examined.

Thank you in advance for any assistance and information you can provide.

All the best,
Dayne

Jason,

I have interviewed Miguel Del Toral, regulations manager for ground and drinking water for the EPA's region 5.

He said there are a number of concerns regarding Flint.

Among other things, he said:

A major concern from a public health standpoint is the absence of corrosion control treatment in the City of Flint for mitigating lead and copper levels in the drinking water.

Recent drinking water samples indicate the presence of high lead results in the drinking water.

In addition to the lack of corrosion control, the ferric chloride being added to help address the TTHM problem can accelerate pipe corrosion, exacerbating the problem.

He also said that the city's testing procedures – instructing residents to "pre-flush" their lines before taking water samples to be tested, can lead to deceptively low results that could give Flint residents a false sense of security regarding actual lead levels in their water.

Obviously, this is a very urgent issue. I am interested to talk with someone from the city about what Mr. Del Toral had to say. Can you set up a phone interview with someone for me to talk with tomorrow? I can make myself available whenever is convenient for you.

If you need to talk with me beforehand, you can reach me on my cell phone at 586-925-0493.

Thanks for any help you can provide.

Subject: Flint Info

Hi Rita/Nick,

Following up on yesterday's conversation…

Sorry for all of the confusion on Flint. I have been keeping Tom and Jen updated, but I did not know that Personal Matters / Ex. 6 Otherwise I would have made sure to brief you folks. The following should clear up some of the confusion and answer a lot of the questions being asked.

My main point here is that we have been keeping MDEQ in the loop and discussing Flint-related issues with them all along. I have done that directly myself or via Jen Crooks. There were a few snafus with information getting jumbled in translation between Jen and I, so I asked that folks wait for the report to be finished so that we are not giving MDEQ inaccurate or conflicting information. I'm not being critical here, just trying to explain the decision making. Tom instructed me to try to finish the report asap so that we could get it to MDEQ, which I was working on trying to do. I wrote the interim report because I realized I could not finish the full report anytime soon because I was (and still am) waiting for some final analyses on some pipes. At the same time I was told to expedite the Flint report, I was also asked to give priority to other State RTCR primacy work and in the middle of all of that, I had the NDWAC and other work, so I issued the interim report, which covered the main issues that were discussed with Tom, Jen and MDEQ. The OEPA primacy package alone was 200+ pages with very detailed comments from Kevin Chow that I had to respond to. The IEPA package was almost as long and I also have the IDPH package that folks want finished asap. I am doing the best I can under the circumstances, and it would help if folks didn't jump to conclusions on Flint before asking. Personal Matters / Ex. 6 Personal Matters / Ex. 6 It's not the workload that is causing the stress, it's the politics and people treating me as if I am doing something wrong. THAT is Personal Matters / Ex. 6 The non-functioning, unreliable EPA network adds to that as I never know from day to day whether I will be able to access the network.

On the MDEQ coordination front…There has been direct communication with MDEQ on all of the Flint related issues, so there is nothing in the interim report that should surprise MDEQ. I had previously discussed our concern with the lack of corrosion control treatment for lead and the use of pre-flushing with Pat Cook who implements the LCR out of the MDEQ central office. Pat Cook confirmed that MDEQ still instructs public water systems to use the pre-flushing and that as of April 30, 2014, Flint does not have corrosion control treatment in place. Based on the email exchanges with Pat Cook back and forth, it is clear that the City of Flint is in violation for either failing to install corrosion control treatment initially as required by the LCR or failure to maintain the treatment when they switched their source from Detroit to the Flint River. As that is a matter for enforcement, I did not state this conclusively in the interim report as I wanted to give the enforcement folks time to go through the details. During our exchanges, Pat Cook informed that it was MDEQ 'policy' to wait for two rounds of monitoring before requiring treatment after a system switches sources. I explained that this MDEQ policy is inconsistent with the LCR regulations, and his response implies that MDEQ may not be implementing the LCR correctly across all large systems.On the issue of pre-flushing…Tom, Jen, and I had also already discussed the issue of pre-flushing with Liane Shekter-Smith during the April State Directors meeting.

So rolling back the clock…this all started when a citizen in Flint (Citizen name / Ex. 6 called Jen on February 25, 2015 about her high lead levels (104ppb). Jen appropriately brought me in on this. A subsequent test by the City came back even higher (397ppb). I contacted Mike Prysby and Steve Busch (MDEQ) on March 19, 2015 regarding the high lead. The MDEQ response from Steve Busch was that the lead was coming from the Citizen name / Ex. 6 home plumbing. The same was being repeated by the City of Flint in public meetings. Citizen name / Ex. 6 was angry and insisted that she had all plastic plumbing.

Since the MDEQ had asked Jen and I to conduct some RTCR training in Bay City on April 27, 2015, and we would be passing right by Flint, we discussed stopping by the Citizen name / Ex. 6 place with Tom on the way back from the Bay City training. Tom agreed and Jen and I stopped by the Citizen name / Ex. 6 place. This is when we verified that all of the plumbing in the home is plastic pipe approved for drinking water applications. That immediately raised red flags in my mind, as the lead had to be coming from outside the home. A lead service line was the likeliest reason, given the prevalence of lead lines in Flint. We had also learned that Citizen name / Ex. 6 had a very long service line and that the water main she was connected to was not cast-iron or ductile iron, but galvanized iron. The zinc used in galvanized iron can contain lead as a contaminant and the most commonly used zinc, Western Grade, can contain up to 2 percent lead. So now we had two potential lead sources: 1) lead service line; and 2) galvanized iron water main.

So the second trip, also approved by Tom, was a last minute decision with multiple objectives:

- As the water at the Citizen name / Ex. 6 had been turned off on April 3, 2015, turning it back on and sampling could provide useful information to inform the LCR rulemaking on whether homes that are unoccupied and subsequently re-occupied might pose a higher risk to the incoming residents where lead service lines are present. The sequential sampling would also inform as to where the lead was coming from.
- Citizen name / Ex. 6 home was connected to the galvanized water main via a very long service line. There were two homes on the same old water main as the Citizen name / Ex. 6 with much shorter service lines, so we conducted sequential sampling at those two homes as well, to gather more information as to whether the galvanized iron water main might be contributing lead to the water. This also has relevance as to how to structure changes to the LCR.
- The Citizen name / Ex. 6 were having their service line replaced, so we wanted to

collect segments from the old service line to analyze the condition of the scale inside the pipe, which we presumed could be a lead service line in whole or in part. On this same trip, we verified that a portion of the Citizen name / Ex. 6 service line is made of lead pipe.

Upon confirming the lack of any treatment, the use of pre-flushing, and incoming high lead results, we became very concerned with the situation in Flint from a public health standpoint.

I'll stop there because I think that should answer most of the questions you had. As I have not been able to get into OWA all morning, please call me if you need anything else. I will be working offline today on the final Flint report and will not be checking email.

Subject: Flint

Hi Liane – I'm following up on the voicemail I left for you earlier today. I'm also copying Carrie Monosmith as I did get a chance to chat with her. In advance of our call scheduled for 7/21/15, I wanted to provide you with an update related to water quality challenges in Flint. I understand that some discussion occurred on June 10th with Tom Poy and staff during the semi-annual call regarding MDEQ's implementation of the LCR rule and the status of Flint. The Region is concerned about the lead situation in Flint and suggested that additional ORD assistance could be provided to Flint's Advisory Committee. We understand that the city is finishing up its second set of 6-month initial monitoring and I have scheduled a call with you on July 21st so we can discuss the Flint situation in more detail.

As you know, my staff have been out to Flint to collect samples and data which we felt could uniquely inform the NDWAC process and ultimately better inform the LCR rulemaking. Tom Poy asked Miguel Del Toral to prepare a report summarizing the visits and findings. Last week Miguel completed a draft interim report and provided it to management. Once Miguel addresses our comments, we will provide you with a copy of that report. In most cases, an internal EPA memo would not be distributed outside the agency, but given his interaction with the homeowner for one of the sampling locations, Miguel has shared a copy of the draft interim report as a courtesy with this Flint resident. Based on Miguel's initial analysis, elevated lead levels were found at this residence. In addition, it appears that the source of the lead may be from outside the home (Note: plumbing in the home is largely plastic).

Please know that Region 5 management is still being briefed on the lead issues in Flint and we look forward to the opportunity to discuss the situation with you in more detail so we can better characterize what MDEQ is already doing in Flint and how public health protection can best be provided to the citizens of Flint. If you would like to discuss this in advance of our call, please feel free to contact myself, or Tim Henry (312-886-6107). Thanks

Subject: Long term treatment change/new source citations

Here are the three places that discuss long-term treatment change and new source requirements and state authorities.

Long-term Change(s) in Treatment or Addition of New Source(s)

This first provision applies to systems that are deemed optimized in accordance with the criteria in 141.81(b)(3) [low lead levels]

141.81(b)(3)(iii)
Any water system deemed to have optimized corrosion control pursuant to this paragraph shall notify the State in writing pursuant to § 141.90(a)(3) of any upcoming long-term change in treatment or addition of a new source as described in that section. The State must review and approve the addition of a new source or long-term change in water treatment before it is implemented by the water system. The State may require any such system to conduct additional monitoring or to take other action the State deems appropriate to ensure that such systems maintain minimal levels of corrosion in the distribution system.

This second provision applies to all systems on reduced monitoring

141.86(d)(4)(vii)
Any water system subject to a reduced monitoring frequency under paragraph (d)(4) of this section shall notify the State in writing in accordance with § 141.90(a)(3) of any upcoming long-term change in treatment or addition of a new source as described in that section. The State must review and approve the addition of a new source or long-term change in water treatment before it is implemented by the water system. The State may require the system to resume sampling in accordance with paragraph (d)(3) of this section and collect the number of samples specified for standard monitoring under paragraph (c) of this section or take other appropriate steps such as increased water quality parameter monitoring or re-evaluation of its corrosion control treatment given the potentially different water quality considerations.

This third provision is only applicable to systems that get lead/copper monitoring waivers and would not apply to Flint.

141.86(g)(4)(iii)
Any water system with a full or partial waiver shall notify the State in writing in accordance with § 141.90(a)(3) of any upcoming long-term change in treatment or addition of a new source, as described in that section. The State must review and approve the addition of a new source or long-term change in water treatment before it is implemented by the water system. The State has the authority to require the system to

add or modify waiver conditions (e.g., require recertification that the system is free of lead-containing and/or copper-containing materials, require additional round(s) of monitoring), if it deems such modifications are necessary to address treatment or source water changes at the system.

Subject: Water treatment

To: Jason Lorenz <jlorenz@cityofflint.com>

Jason,

I have interviewed Miguel Del Toral, regulations manager for ground and drinking water for the EPA's region 5.

He said there are a number of concerns regarding Flint.

Among other things, he said:

A major concern from a public health standpoint is the absence of corrosion control treatment in the City of Flint for mitigating lead and copper levels in the drinking water.

Recent drinking water samples indicate the presence of high lead results in the drinking water.

In addition to the lack of corrosion control, the ferric chloride being added to help address the TTHM problem can accelerate pipe corrosion, exacerbating the problem.

He also said that the city's testing procedures – instructing residents to "pre-flush" their lines before taking water samples to be tested, can lead to deceptively low results that could give Flint residents a false sense of security regarding actual lead levels in their water.

Obviously, this is a very urgent issue. I am interested to talk with someone from the city about what Mr. Del Toral had to say. Can you set up a phone interview with someone for me to talk with tomorrow? I can make myself available whenever is convenient for you.

If you need to talk with me beforehand, you can reach me on my cell phone at 586-925-0493.

Thanks for any help you can provide.

I am just wondering when Detroit was deemed optimized, did the notification automatically apply to the consecutives, and were they notified, or did each consecutive get treated as an individual system with separate notification of optimization.

Did the state approve the new source in writing per 141.90 (a)(3)

(3) At a time specified by the State, or if no specific time is designated by the State, then as early as possible prior to the addition of a new source or any long-term change in water treatment, a water system deemed to have optimized corrosion control under § 141.81(b)(3), a water system subject to reduced monitoring pursuant to § 141.86(d)(4), or a water system subject to a monitoring waiver pursuant to § 141.86(g), shall submit written documentation to the State describing the change or addition. The State must review and approve the addition of a new source or long-term change in treatment before it is implemented by the water system. Examples of long-term treatment changes include the addition

of a new treatment process or modification
of an existing treatment process.
Examples of modifications include
switching secondary disinfectants,
switching coagulants (e.g., alum to ferric
chloride), and switching corrosion
inhibitor products (e.g.,
orthophosphate to blended phosphate).
Long-term changes can include dose
changes to existing chemicals if the
system is planning long-term changes
to its finished water pH or residual inhibitor
concentration. Long-term
treatment changes would not include
chemical dose fluctuations associated
with daily raw water quality changes

Subject: flint --> lcr milestone data in sdwis/fed (no info for flint; deem for detroit)
mi_lcr_milestones.xlsx

Hi All,

Miguel asked for the LCR milestone data we have in SDWIS/FED for Flint and Detroit. I thought it might be useful for the whole group. For reference, all of the DEEM, DONE, and LSLR data for MI from SDWIS/FED is attached.

There is nothing in SDWIS/FED for Flint DEEM, DONE, or LSLR. There is a DEEM for Detroit, as follows:

[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
[illegible]	DETROIT CITY OF	6/30/1999	5/19/2004	DEEM	System deemed optimized without OCCT	B3	Serving greater than 50,000: met action levels

Isn't it well known that SDWIS/FED data for LCR milestones are unreliable and incomplete? As such, I'm not sure how much we can read into Flint not having any DEEM or DONE milestones in our database.

If there are any other data questions, just let me know. I'm happy to help.

Thanks,

Andrea Porter

Subject: Long term treatment change/new source citations

Here are the three places that discuss long-term treatment change and new source requirements and state authorities.

Long-term Change(s) in Treatment or Addition of New Source(s)

This first provision applies to systems that are deemed optimized in accordance with the criteria in 141.81(b)(3) [low lead levels]

141.81(b)(3)(iii)

Any water system deemed to have optimized corrosion control pursuant to this paragraph shall notify the State in writing pursuant to § 141.90(a)(3) of any upcoming long-term change in treatment or addition of a new source as described in that section. The State must review and approve the addition of a new source or long-term change in water treatment before it is implemented by the water system. The State may require any such system to conduct additional monitoring or to take other action the State deems appropriate to ensure that such systems maintain minimal levels of corrosion in the distribution system.

This second provision applies to all systems on reduced monitoring

141.86(d)(4)(vii)

Any water system subject to a reduced monitoring frequency under paragraph (d)(4) of this section shall notify the State in writing in accordance with § 141.90(a)(3) of any upcoming long-term change in treatment or addition of a new source as described in that section. The State must review and approve the addition of a new source or long-term change in water treatment before it is implemented by the water system. The State may require the system to resume sampling in accordance with paragraph (d)(3) of this section and collect the number of samples specified for standard monitoring under paragraph (c) of this section or take other appropriate steps such as increased water quality parameter monitoring or re-evaluation of its corrosion control treatment given the potentially different water quality considerations.

This third provision is only applicable to systems that get lead/copper monitoring waivers and would not apply to Flint.

141.86(g)(4)(iii)

Any water system with a full or partial waiver shall notify the State in writing in accordance with § 141.90(a)(3) of any upcoming long-term change in treatment or addition of a new source, as described in that section. The State must review and approve the addition of a new source or long-term change in water treatment before it is implemented by the water system. The State has the authority to require the system to add or modify waiver conditions (e.g., require recertification that the system is free of lead-containing and/or copper-containing materials, require additional round(s) of monitoring), if it deems such modifications are necessary to address treatment or source water changes at the system.

Subject: RE: Long term treatment change/new source citations

I am just wondering when Detroit was deemed optimized, did the notification automatically apply to the consecutives, and were they notified, or did each consecutive get treated as an individual system with separate notification of optimization.

Did the state approve the new source in writing per 141.90 (a)(3)

(3) At a time specified by the State, or if no specific time is designated by the State, then as early as possible prior to the addition of a new source or any long-term change in water treatment, a water system deemed to have optimized corrosion control under § 141.81(b)(3), a water system subject to reduced monitoring pursuant to § 141.86(d)(4), or a water system subject to a monitoring waiver pursuant to § 141.86(g), shall submit written documentation to the State describing the change or addition. The State must review and approve the addition of a new source or long-term change in treatment before it is implemented by the water system. Examples of long-term treatment changes include the addition of a new treatment process or modification of an existing treatment process. Examples of modifications include switching secondary disinfectants, switching coagulants (e.g., alum to ferric chloride), and switching corrosion inhibitor products (e.g., orthophosphate to blended phosphate). Long-term changes can include dose changes to existing chemicals if the system is planning long-term changes to its finished water pH or residual inhibitor concentration. Long-term treatment changes would not include

chemical dose fluctuations associated
with daily raw water quality changes

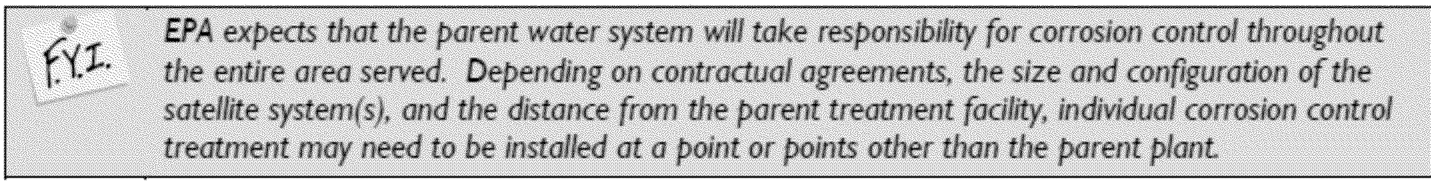
Subject: RE: Long term treatment change/new source citations

Hi All,

I've been looking through our guidance for corrosion control at consecutive systems. It seems like, as of 2010, we would expect Detroit (the wholesaler) to be responsible for corrosion control treatment for Flint (see excerpt and link below) as long as Flint was a consecutive system.

Source = Lead and Copper Rule Monitoring and Reporting Guidance for Public Water Systems, March 2010 (http://water.epa.gov/lawsregs/rulesregs/sdwa/lcr/upload/Revised-Lead-and-Copper-Rule-Monitoring-and-Reporting-Guidance-for-Public-Water-Systems.pdf):



EPA expects that the parent water system will take responsibility for corrosion control throughout the entire area served. Depending on contractual agreements, the size and configuration of the satellite system(s), and the distance from the parent treatment facility, individual corrosion control treatment may need to be installed at a point or points other than the parent plant.

Thanks,

Andrea Porter

Subject: Long term treatment change/new source citations

Here are the three places that discuss long-term treatment change and new source requirements and state authorities.

Long-term Change(s) in Treatment or Addition of New Source(s)

This first provision applies to systems that are deemed optimized in accordance with the criteria in 141.81(b)(3) [low lead levels]

141.81(b)(3)(iii)

Any water system deemed to have optimized corrosion control pursuant to this paragraph shall notify the State in writing pursuant to § 141.90(a)(3) of any upcoming long-term change in treatment or addition of a new source as described in that section. The State must review and approve the addition of a new source or long-term change in water treatment before it is implemented by the water system. The State may require any such system to conduct additional monitoring or to take other action the State deems appropriate to ensure that such systems maintain minimal levels of corrosion in the distribution system.

This second provision applies to all systems on reduced monitoring

141.86(d)(4)(vii)

Any water system subject to a reduced monitoring frequency under paragraph (d)(4) of this section shall notify the State in writing in accordance with § 141.90(a)(3) of any upcoming long-term change in treatment or addition of a new source as described in that section. The State must review and approve the addition of a new source or long-term change in water treatment before it is implemented by the water system. The State may require the system to resume sampling in accordance with paragraph (d)(3) of this section and collect the number of samples specified for standard monitoring under paragraph (c) of this section or take other appropriate steps such as increased water quality parameter monitoring or re-evaluation of its corrosion control treatment given the potentially different water quality considerations.

This third provision is only applicable to systems that get lead/copper monitoring waivers and would not apply to Flint.

141.86(g)(4)(iii)

Any water system with a full or partial waiver shall notify the State in writing in accordance with § 141.90(a)(3) of any upcoming long-term change in treatment or addition of a new source, as described in that section. The State must review and approve the addition of a new source or long-term change in water treatment before it is implemented by the water system. The State has the authority to require the system to add or modify waiver conditions (e.g., require recertification that the system is free of lead-containing and/or copper-containing materials, require additional round(s) of monitoring), if it deems such modifications are necessary to address treatment or source water changes at the system.

Subject: Draft Notes from Michigan semi-annual call on 6/10

All--Below are my draft notes from our call last week, June 10, 2015. Thank you all for participating. I apologize for the delay in getting these out in draft to you all for review--I was hoping to get a couple of items ironed out that were fuzzy during our discussions, but hasn't happened yet. Several ACTION items below. So, please review to make sure I documented our discussion/agreements correctly, and feel free to edit as needed. I you could get back to me by July 13, that would be great. Thank you!

Jennifer

Attendees:
MDEQ: Liane Shekter-Smith, Richard Benzie, Carrie Monosmith, Kris Philip, Dan Dettweiler, Marjorie Rodriguez (Student), Kevin Holdwick, Mike Prysby, Dana DeBruyn, Steve Busch
EPA Region 5: Tom Poy, Rita Bair, Nick Damato, Janet Kuefler, Michele Palmer, Tom Murphy, Heather Shoven, Cary McElhinney, Andrea Porter, Miguel Deltoral, Mostafa Noureldin

Summary:

1.Changes in Lead Disinvestments and Commitments for FY 2016 ARDP--for discussion: Due to our extreme focus on lead in drinking water, this is the consensus here.

a. Consumer notification of tap results at NTNCWSs:
(Suggested wording) The NCWS program commits to full implementation of the lead consumer notification of tap results requirement, to begin in CY 2016. Region 5 will assist in a notification outreach effort in late FY 2015 to remaining 698 NTNCWSs that are not schools/daycares, to begin providing lead consumer notice in CY 2016. NCWS program commits to include information on providing lead consumer notice in the annual monitoring letter sent to all NTNCWSs for CY 2016.

STATE: The State found this change in the wording acceptable.

b. Collection of Lead samples at NTNCWSs during June - September 2016 timeframe
(Suggested wording) NCWS program commits to including information in the

applicable NTNCWS annual monitoring letters of the requirement to collect their annual/triennial lead sample between June and September only, during CY 2016. The MDEQ NCWS program currently does not have the capability to easily track lead sampling compliance within this specific timeframe.

STATE: The State found this change in the wording acceptable.

c. Follow-up Actions for NTNCWSs that sample outside of June-September 2015 timeframe
(From 5/5/15 call notes w/EPA) MDEQ commits to providing Region 5 with all CY 2015 lead (and copper?) sample data for all NTNCWSs by March 2016 so that EPA can analyze how many PWSs monitored outside the June through October timeframe. EPA commits to follow-up with MDEQ to discuss follow-up actions.

STATE: The State agreed to providing EPA R5 the raw lead and copper data for all CY 2015 for all NTNCWSs. The WaterTrack database does have data, but it can't generate violations. MDEQ doesn't commit to enforcing against 2016 violators in FY 2016. The State said, it is planning on disinvesting in enforcing against these violators due to limited capability of WaterTrack; however, if the State's noncommunity data management capabilities improve during FY 2016, implementation of this disinvestment may become a reality. The State has not designated an alternate timeframe, or done system specific documentation as to why the system qualifies for a different timeframe.

d. Submittal of the lead and copper reporting form
(Suggested wording) MDEQ commits to requiring CWSs and NTNCWSs to submit the lead and copper reporting form via the annual monitoring letters to each system, tracking CWSs and NTNCWSs submittal of the lead and copper reporting form, and commits to issuing violations for failure to submit the lead and copper reporting form. The reporting form provides the address of the sample site, designates sampling site selection criteria, and explanation(s) for any changes in sampling sites.

STATE: Dan Dettweiler stated that the NCWS program was not in a position to do this for the NTNCWSs at this time. Tom Murphy asked how does WaterTrack handle/track high lead results? Tom M said there is a truncation issue on the sample location name field. Dan acknowledged that this problem has been identified, and the Department of Technology Management and Budget (DTMB) has been trying to fix this problem, but it is a challenging problem. Dan stated that sample sites for NTNCWSs are actually identified by LHDs during the sanitary survey and are documented in the sanitary survey. The LHDs check the pdf of the laboratory results that clearly states where the sample was taken, and calculates the 90th percentile. However, Dan stated that the requirement to send in the lead and copper reporting form is not currently in the LHD annual monitoring letter sent to each system. The NTNCWSs do not couple this form to the Lead Consumer Notice, as does the CWSs. Kris Philip pointed out that the LHDs select the sample sites, thus when they are calculating the 90th percentile, they are actually double checking the sites with the results.

From our discussion, the Region concluded that at this time, the LHDs are actively reviewing the lead and copper results and the sample locations when they calculate the 90th percentiles to ensure proper LCR monitoring is conducted by ALL NTNCWSs at the proper sample sites. After our call, I asked for verification of this statement, and Dan Dettweiler responded, "Just as with an exceeding value of an MCL, WaterTrack alerts the LHD when at least one sample for a water system exceeds the AL. A 90th percentile calculation is made only when an exceeding result alerts the LHD. For cases where there are no exceeding results, private lab samples are reviewed at the time LHDs hand-enter them into WaterTrack. State lab samples, which flow electronically via nightly downloads from the state lab database, are reviewed when pdfs of the analysis reports are, routinely, emailed by the state lab to LHDs. Beyond that, MDEQ's annual evaluation of the LHDs provides another opportunity for us to oversee the proper assigning and use of designated sampling locations."

ACTION: The Region will discuss Dan's response internally, and get back to the State with any issues/concerns.

Kris Philip said that the CWS program is requiring that the systems submit the form, but they are not enforcing whether or not the system submits the form. Often, the CWS will submit the Lead Consumer Notice and the Lead and Copper reporting form together. Kris said if 90%+ are already submitting the forms, then the State will agree to follow-up and enforce this requirement. But, if less than that, will probably be too much of a burden. Kris said they may change the way DEQ is tracking in SDWIS during FY 2016. But, the Region said SDWIS-Prime probably won't be available until 2017 at the earliest.

ACTION: Kris Philip will research with the District Offices to determine the current submittal rate of the lead and copper reporting form from CWSs; and report back to the Region.

2. Enforcement Update with Heather

NTNCWSs under Bottled Water agreements due to Arsenic MCL violations:

Per discussions with Region 5 and the February 2014 EPA/OECA memo, MDEQ has closed the old Arsenic open-ended MCL violations; however, no further quarterly monitoring is being conducted at the (±27) systems that are still under bottled water agreements. Thus, no more arsenic MCL violations will be reported for these systems and these systems will not become priority systems (ETT score of 11 or more) since only one arsenic MCL violation will be reported (5 points) even though they have a longstanding issue with arsenic noncompliance. The Region would like to discuss the pros and cons of placing these PWSs with arsenic MCL violations on quarterly monitoring as required under 40 CFR Section 141.23(c)(7); and brainstorm possible solutions.

Heather provided an update on how the State is doing in returning ETT systems to compliance; the State is doing very well in achieving its commitment for FY 2015. Heather said the Region is glad to see the State and LHD prioritization of implementation of the drinking water program and NTNCWS schools and daycares.

Referring to the NTNCWSs under BW agreements that are in violation of the Arsenic MCL, Heather said that since there are no more open-ended MCL violations in SDWIS, that no MCL violations can be reported to SDWIS unless there is monitoring to show the system is in non-compliance. Even though the LHD has indicated that these systems are drinking bottled water for public health protection, the use of bottled water cannot be a permanent solution to the fact that the system's drinking water at the tap continues to exceed the MCL for arsenic. Dan said there are 22 systems, where 8 are schools, that should be conducting quarterly monitoring. Dana said that letters have been sent (OR drafted?) to these 22 systems to require quarterly sampling for arsenic; these 22 systems are in 10 different counties so the message from the

State is consistent. A secondary effect of this new requirement for the systems, may be that they transition to another water source or install treatment sooner.

The State voiced a concern that multiple quarterly violations could potentially affect the State's relationship with the LHDs financially. Genesee and Oakland Counties have quite a number of noncommunity water systems. Multiple quarterly violations could affect the Dept of Community Health's determination as to whether the LHDs are meeting their minimum program requirements; thus receive full funding for their work with the noncommunity systems for the drinking water program. The LHDs cannot have more than 20% of their systems with violations. The Region wonders how much funding would be cut from a LHD contract if it exceeds the 20% noncompliance level set in the contract?

3. Status of Flint
   a. TTHM levels for May--Due to MDEQ district engineer June 10-RECEIVED; see link to results https://www.cityofflint.com/2015/06/01/may-water-testing-results-show-all-locations-are-within-acceptable-limits-for-tthm/
   All samples below the TTHM MCL; one site still has an LRAA above the MCL but decreased from 105 ppb in Feb to 93.5 ppb in May.

   Mike Prysby said he is getting ready to issue the construction permit to the City of Flint to install a GAC filter in July, that will remove more TOC to further reduce the potential of developing TTHMs. Mike said he has already issued a construction permit for a transmission line within the City that will help reduce water age.

   b. Lead in Flint
   Our discussions with MDEQ indicate that no phosphates/corrosion control has been added to the system since April 2014 when the source of drinking water changed to the Flint River. We understand that the City is just finishing up its second set of 6-month initial monitoring for lead; where the results will probably warrant a Corrosion Control Study to be conducted. Since Flint has lead service lines, we understand some citizen-requested lead sampling is exceeding the Action Level, and the source of drinking water will be changing again in 2016, so to start a Corrosion Control Study now doesn't make sense. The idea to ask Flint to simply add phosphate may be premature; there are many other issues and factors that must be taken into account which would require a comprehensive look at the water quality and the system before any treatment recommendations can/should be made. Miguel is recommending MDEQ and EPA? approach Flint about formally requesting EPA's Office of Research and Development in Cincinnati support on the lead in Flint drinking water issue, and request that Mike Schock, ORD, and possibly Darren Lytle, ORD, to participate in Flint's drinking water advisory committee so that a comprehensive evaluation on how to proceed can be discussed.

   Miguel provided a brief summary of the high lead results found at the residence of Citizen name / Ex. 6 Citizen name / Ex. 6 in Flint. Miguel will follow up with a written summary of the work conducted, sample results, and conclusions.
   Miguel believes that lead levels in Flint are being affected by the lack of Corrosion Control being conducted by the City, since the LCR requires 2 6-month initial monitoring for a new source. Steve Busch stated that in the Lead sampling pool, almost all of the lead sample sites are lead service lines, and the State is not seeing large increases in lead levels at the tap. Miguel

suggested that EPA experts in Lead, Mike Schock; and in distribution systems, Darren Lytle, be added to the Flint drinking water advisory committee to assist the City/State in determining the best way to proceed to minimize lead in the City's drinking water during the interim use of the Flint River, and subsequent use of Lake Huron water.

Miguel said he will send Mike Schock and Darren Lytle's contact information to Steve and Mike. Steve pointed out that the City is following the LCR requirements, and completing the requirements in a timely manner. Miguel's point is that since the LCR was promulgated 20+ years ago, that research and different situations, like Washington D.C., have educated scientists, experts, and regulators that the existing requirements in the LCR may not be as protective as previously thought. Thus, he can only make recommendations as to how to revise sampling protocols. And Miguel acknowledges that it may be another year before these regulation changes are promulgated in the Long-Term Lead and Copper Rule. In December 2015, the NDWAC recommendation is expected.

The Region asked the State if the Flint River will be a permanent supplemental source of drinking water, once the City of Flint connects with the Karegdodi pipeline from Lake Huron. Mike Prysby said that the City is currently pumping 22MGD, but the City has 40-50 MG of storage. The City is currently working on reducing its unaccounted for water losses, and these water losses are dropping. The State, through the Governor's office, provided disadvantaged system funding, $2M which includes $900K for lead detection, and pipe inspection.

4. Update on WaterTrack to SDWIS-State: The migration of WaterTrack data to SDWIS-State was number 39 on the Dept of Technology Management and Budget's (DTMB) project list last year; this year it is
number 30. It doesn't appear this project has a high priority. Does the State have any new information on the progress of this project?

Dan said that the migration of WaterTrack data to SDWIS-State has moved to a priority of 26 with DTMB so far this year. But Dan said they are going to take this project out of the que, since Ronda Page has returned to the drinking water program from DTMB. Ronda said she re-estimated DTMB's involvement in this project to be far less than originally thought, so there is no need for any program developers or the tech team. This project will only need the Data Team and the web designers only. Ronda said they can set-up on a new server and migrate the data from WaterTrack to SDWIS-State themselves; in-house. Kris Philip remembers migrating the CWS data to SDWIS-State, so she can be a resource for this project. The parts that are needed to be completed by DTMB could be contracted out. Cary McElhinney said that there is a process of withholding PWSS grant funds and re-directing the funds to a HQ contract with SAIC. Richard Benzie said the process worked well last year when MI used PWSS funds to contract with a HQ contractor to conduct NEEDS survey training.

ACTION: Jen will follow up with State and Tribal Programs Branch about the process and timing of holding back funds from the PWSS grant for the purpose of contracting with SAIC.

5. Consequences of cutting the State drinking water program to a "minimal program"
Jennifer had a discussion with Richard Benzie regarding the possibility of the Michigan State Legislature looking to have just a minimal drinking water program, meaning only a program with activities that are required by the Federal SDWA. Jennifer ultimately discussed this internally

with Tom Poy. The minimal program suggested would cut out Operator Certification, Capacity Development, Plan Review, Cross Connection Control, Source Water Protection, among other programs that are State required. Operator Certification and Capacity Development, while not required by the Federal regulations, do have financial strings attached. And Plan review/construction permits are required by the SRF program for a loan. Any recent communication with the State Legislature that they might proceed and make this possibility a reality?

Richard and Liane said there is no current threat from the State Legislature to cut the State-funded PWSS program activities. But there is a State-wide impetus to delete old programs and regulations, so this could lead to questioning the purpose of State-funded PWSS program activities. Richard is just being proactive in preparing a justification. Richard remembers a discussion many years ago about what constitutes a "comprehensive drinking water program". Tom Poy and Jennifer commented in a previous communication with Richard that the EPA PWSS primacy program and the State-funded activities in the drinking water program were meant to complement each other. To support this statement, Jennifer sent Richard some PWSS Priority guidance from the 90's, some preamble language from the 1976 SDWA found by our attorney, and language from Section 142 of the SDWA regulations from 1976 that might assist him in his justification.

6. EPA's Resource Message at the LHD Workshop in April
From the 2014 analysis of Shared Goals 2013 data, which is compliance data, for noncommunity systems, there are increasing trends of nitrate M/R violations for both NTNCWSs and TNCWSs. We discussed this on the last semi-annual call. Analysis of the 2015 Shared Goals 2014 data (April 2015) shows an improvement--that of decreasing numbers of bacti/nitrate M/R violations.

However, in light of the upcoming implementation of RTCR in 2016, the question raised here in the Region is:
Does the State have a plan with the LHDs as to what activities must be prioritized, and what will fall off the plate? Not all LHDs will need to disinvest based upon each LHD's resources, but some poorly funded LHDs may have to disinvest in some activities/drop activities that have no risk to public health.

Carrie Monosmith said that she met with the RTCR workgroup, comprised of LHD Directors/sanitarians, last fall to identify activities that the state can disinvest in during the next several years as the LHDs begin implementation of RTCR. They could not identify any activity that could be dropped. The main thing that will help the LHDs save time is to get the electronic DWR (eDWR) going, or the CMD portal, which will drastically reduce the LHDs time in inputting laboratory data into WaterTrack/SDWIS-State. From there, they can develop electronic data forms (CROMEER compliant) that the systems can submit.

Thank you!

Jennifer

To: Jason Lorenz <jlorenz@cityofflint.com>

Jason,

I have interviewed Miguel Del Toral, regulations manager for ground and drinking water for the EPA's region 5.

He said there are a number of concerns regarding Flint.

Among other things, he said:

A major concern from a public health standpoint is the absence of corrosion control treatment in the City of Flint for mitigating lead and copper levels in the drinking water.

Recent drinking water samples indicate the presence of high lead results in the drinking water.

In addition to the lack of corrosion control, the ferric chloride being added to help address the TTHM problem can accelerate pipe corrosion, exacerbating the problem.

He also said that the city's testing procedures – instructing residents to "pre-flush" their lines before taking water samples to be tested, can lead to deceptively low results that could give Flint residents a false sense of security regarding actual lead levels in their water.

Obviously, this is a very urgent issue. I am interested to talk with someone from the city about what Mr. Del Toral had to say. Can you set up a phone interview with someone for me to talk with tomorrow? I can make myself available whenever is convenient for you.

If you need to talk with me beforehand, you can reach me on my cell phone at 586-925-0493.

Thanks for any help you can provide.

Curt Guyette

At this point, I am not inclined for my staff to have any further communications with the ACLU representative -- we need to focus on finalizing the report. In the meantime, however, I have no objection to the City letting him know that the report he was given was a preliminary draft and that it would be premature to draw any conclusions based on that draft.

Also, if you decide that you would like additional expertise in the area of treatment and corrosion control to address lead contamination – we can deploy resources from the EPA lab in Cincinnati. The resumes of two experts in this area are attached – and we can make the necessary connections if you think you would like to add to your Advisory Committee.

I hope you have a Happy Fourth of July!

Jason,

I have interviewed Miguel Del Toral, regulations manager for ground and drinking water for the EPA's region 5.

He said there are a number of concerns regarding Flint.

Among other things, he said:

A major concern from a public health standpoint is the absence of corrosion control treatment in the City of Flint for mitigating lead and copper levels in the drinking water.

Recent drinking water samples indicate the presence of high lead results in the drinking water.

In addition to the lack of corrosion control, the ferric chloride being added to help address the TTHM problem can accelerate pipe corrosion, exacerbating the problem.

He also said that the city's testing procedures – instructing residents to "pre-flush" their lines before taking water samples to be tested, can lead to deceptively low results that could give Flint residents a false sense of security regarding actual lead levels in their water.

Obviously, this is a very urgent issue. I am interested to talk with someone from the city about what Mr. Del Toral had to say. Can you set up a phone interview with someone for me to talk with tomorrow? I can make myself available whenever is convenient for you.

If you need to talk with me beforehand, you can reach me on my cell phone at 586-925-0493.

Thanks for any help you can provide.

Curt Guyette

At this point, I am not inclined for my staff to have any further communications with the ACLU representative -- we need to focus on finalizing the report. In the meantime, however, I have no objection to the City letting him know that the report he was given was a preliminary draft and that it would be premature to draw any conclusions based on that draft.

Also, if you decide that you would like additional expertise in the area of treatment and corrosion control to address lead contamination – we can deploy resources from the EPA lab in Cincinnati. The resumes of two experts in this area are attached – and we can make the necessary connections if you think you would like to add to your Advisory Committee.

I hope you have a Happy Fourth of July!

Subject: RE: Bios for Mike Schock and Darren Lytle from EPA's Office of Research and Development

Jennifer,

Mike has been out and won't likely return until next Monday 7/6. I have not been in touch with the City on this yet. The City's Pb/Cu monitoring period ends tomorrow 6/30, so by 7/10 we should also have a better idea where the City stands.

As you saw from the June 9, TTHM MCL VN, only one compliance sample (out of 24) in the last 9 months exceeded 80 ppb (Site DBP4, 94 ppb, 11/20/14).

TOC removal has been effective at the WTP, and with the upcoming GAC filter media changeout should be even more effective.

Total Coliform has not been an issue for the last 9 months, since September 2014, and work on the distribution system has improved chlorine residuals (with additional transmission main work planned over the next couple of years).

So at this point I don't think we have any questions.

Subject: Re: One more water question

Hi Rita,

There were four sets of diagnostic (sequential) samples were collected as follows:

- 1st set: Samples collected by Citizen name / Ex. 6 and sent to VT, per request from Citizen name / Ex. 6 to Dr. Marc Edwards at VT.
- 2nd & 3rd sets: Samples were collected by myself at two residents drawing from the same water main as the Citizen name / Ex. 6 The sampling instructions and protocol used was the same as in the Chicago study. No formal QAPP was developed for these samples. The sampling and analytical procedure were the same as what the region approved for the Chicago study.
- 4th set: Collected by Citizen name / Ex. 6 shipped to and analyzed by EPA CRL following the replacement of the Citizen name / Ex. 6 service line.

All pipe samples: All work has been done by VT on behalf of Citizen name / Ex. 6

Regarding the EPA/VT connection...Dr. Edwards has conducted extensive research on lead in drinking water, corrosion and corrosion control. He and I and Mike Schock discuss lead in drinking water, corrosion and corrosion control issues from time to time to evaluate the latest published research relevant to EPA's work on the upcoming LCR revisions. Dr. Edwards is an internationally recognized expert in the area of corrosion and corrosion controland served as a technical resource for the NDWAC LCR WG. With Citizen name / Ex. 6 permission, Dr. Edwards has shared the data/information from his work with Citizen name / Ex. 6 with EPA R5.

Hope that helps clarify things.

Miguel A. Del Toral

Subject: FW: One more water question

Miguel, First, please don't shoot the messenger. Can you provide me with a response to Tim's questions below? I told Tim that I did not believe we developed a QAPP for Flint sampling, but needed you to confirm that. I'm also not sure if you personally took the samples or not and if that makes a difference for when a QAPP is needed, but his position is that if EPA is using data that we collected for a written report that we need a QAPP. Questions are also being raised about the role of and relationship we have with VA Tech and why were they analyzing drinking water samples and pipe segments. Any information you can provide to answer those questions would be greatly appreciated.

Subject: FW: One more water question

Can you please get me the QAPP that covers the sampling/analysis described in the interim report Miguel drafted for Tom? Likewise, any agreement including QAPP between EPA and VA

Tech, which according to the interim report did some of the analyses.

Subject: ACLU story on Flint drinking water: Corrosive Impact: Leaded Water and One Flint Family's Toxic Nightmare

This just in … I haven't had a chance to read it yet, but I assume you'll be hearing from the mayor again shortly. Migel del Toral, the Water Division staffer quoted at length in the article, describes it as full of mischaracterizations and inaccuracies.

Corrosive Impact: Leaded Water and One Flint Family's Toxic Nightmare

Jul 09 Posted by Curt Guyette in Democracy Watch

It took a while for LeeAnne Walters to realize the full impact of the number: 13,200.

Walters—a stay-at home mom with four sons and a husband in the Navy—had seen other numbers reflecting the quality of drinking water at her Flint home that were devastating. But 13,200? She'd never seen anything like this.

The city had tested her water twice in this past March and both times found dangerously high levels of lead—104 parts per billion (ppb) and 397 ppb, respectively.

Those numbers filled her with dread, because they meant her family had been exposed to high levels of a terribly toxic heavy metal that put her children's future in jeopardy.

But it was the result of a third test of the tap water in her home, performed by independent experts at Virginia Tech university, that most stunned Walters.

“It took a while for me to wrap my head around it,” said Walters.

The VT researchers discovered lead levels in Walters’ water reached a jaw-dropping 13,200 ppb—more than twice the amount at which the U.S. Environmental Protection Agency classifies water as hazardous waste.

“When I saw those numbers I was shocked,” said Virginia Tech professor Marc Edwards, a former MacArthur Fellow and respected authority on corrosion in drinking-water systems, who oversaw the tests.

Edwards played a key role in discovering the problem of corroded water pipes and lead in Washington, D.C. drinking water during the early 2000s, in what has been described as one of the worst contamination events ever seen in an urban water system, with resulting increased incidence of childhood lead poisoning, miscarriages and fetal death.

In terms of lead levels, the Walters family’s numbers eclipsed even the worst D.C. homes.

“I have never in my 25-year career seen such outrageously high levels going into another home in the United States,” said Edwards. “This was literally hazardous-waste levels.”

But the condition of Walters’ tap water raises a much more far-reaching question: Since the city moved away from Detroit’s water system and began pumping water from the Flint River, how many other families have been put at risk by the city’s questionable testing procedures and handling of the water supply?

The Walters family surely isn’t alone in dealing with the threat of lead-laced drinking water. About half of Flint’s 40,000 homes are a half-century old or older, built at a time when water service lines were typically made of lead.

And according to various experts, including an EPA water-quality specialist, the city's actions are only exacerbating the threat.

"What the public needs is accurate information," explained Miguel Del Toral, regulations manager for the Ground Water and Drinking Water Branch of the EPA's Region 5.

Instead, the city is utilizing testing measures that almost ensure that worst-case scenarios such as the one facing the Walters family escape detection, asserted Del Toral in an internal EPA memo provided to the ACLU of Michigan.

Compounding the threat is what Del Toral describes as the continued inability of officials to adequately treat water coming into people's homes from the Flint River.

"I don't want to scare people unnecessarily," said Del Toral in a phone interview from his home in Chicago. "But there is absolutely a problem in Flint that needs to be addressed right away."

During his interview with the ACLU of Michigan, Del Toral said he was willing to go on the record with his concerns, but that he was doing so as a private citizen, not as a representative of the EPA.

EPA rules, he said, required that such interviews be routed through the agency's public affairs people. But he's willing to speak out nonetheless, he said, because of the potential harm to the public is so great, and the need to address it is so urgent.

WATERING DOWN THE TESTS

Perhaps the most vexing problem in all of this is the contamination caused by the city's decades-old network of lead and iron pipes—a problem directly connected to the switch to river water, and the city's failure to adequately treat it.

Under the U.S. Environmental Protection Agency's rules, if lead reaches a level of 15 parts per billion in water, the source of the problem must be identified and corrected.

In early March, after months of requests (and only after Walters had received a doctor's note raising concerns about problems with the water), the city finally conducted a test. It found lead levels of 104 ppb the first time. A second test recorded a level of 397 ppb.

Blood tests, taken after those water-sample numbers were reported, revealed that one of her children, a four year old, had lead poisoning.

The news was devastating, said Walters, and the concern it creates for her child's future is haunting.

"Lead can affect almost every organ and system in your body," according to the EPA's web site. "Children six years old and younger are most susceptible … Even low levels of lead in the blood of children can result in: behavior and learning problems; lower IQ and hyperactivity; slowed growth; and hearing problems."

Those dangers made Walters all the more determined to get her questions answered.

For one thing, she wanted to know why residents were being instructed to "pre-flush" water lines before drawing samples that would be tested by the city

After much searching, she found Del Toral at the EPA's Region 5 in Chicago. He explained to her that her instincts were right, and that she had good cause to be concerned about the way testing was being done.

“The practice of pre-flushing before collecting compliance samples has been shown to result in the minimization of lead capture and significant underestimation of lead levels in drinking water,” wrote Del Toral in an internal memo dated June 24.

Del Toral went on to say that the city’s testing methods were a “serious concern” because they “could provide a false sense of security to the residents of Flint regarding lead levels in the water.” As a result, he warned, residents could fail to take the necessary precautions to protect their families from lead in the drinking water.

Virginia Tech’s Edwards completely agrees with Del Toral’s assessment.

“The net effect of a ‘pre-flush’ is to greatly reduce the likelihood of detecting lead in samples collected … that would normally be present in the consumers drinking water,” Edwards wrote in an email. “I have long maintained that the practice should be banned, as it artificially lowers the amount of lead detected in samples versus typical consumer exposure.”

Asked about these concerns, city spokesman Jason Lorenz offered the following email reply: “While I cannot directly respond to Mr. Del Toral's remarks without first contacting the EPA Region 5 office, I can say that the City of Flint follows all the testing procedures and schedules as required by the U.S. EPA.”

He added that the Michigan Department of Environmental Quality (MDEQ) endorses the city’s sampling method. The MDEQ did not respond to phone calls and e-mails seeking its comments on the controversy.

Del Toral contended in an interview that what Flint’s doing is actually exploiting a “loophole” in the law.

“From a technical standpoint, there’s no justification for the way Flint is conducting its tests,” Del Toral said. “Any credible scientist will tell you [the city’s] method is not the way to catch worst-case conditions.”

There is no legitimate reason for the city's methodology, said Del Toral.

EPA rules, he said, required that such interviews be routed through the agency's public affairs people. But he was willing to speak out nonetheless, he said, because of the potential harm to the public.

FLUSHING OUT REAL ANSWERS

It was Del Toral who, after determining that the lead problem plaguing the Walters family was coming from outside their home, connected LeeAnne with Edwards at Virginia Tech.

Instead of taking a single sample after a line had been "pre-flushed" under the city's direction, Edwards instructed Walters to collect a series of samples from water that had been allowed to sit in the service line long enough to accurately reflect levels the family could be exposed to under normal use.

(Meanwhile, that same service line, dug up and replaced after the sample collection, was found to be made of lead in one section and iron in another.)

Edwards tested the water and discovered that the lead contamination ranged from 200 ppb to the 13,200 ppb figure that stunned LeeAnne Walters—and should likewise shock many others.

Given the age of much of Flint's infrastructure, Edwards agrees with Del Toral's assessment that the test results they found at the Walters home amount to an alarm going off, and others in the city need to pay attention.

“I do not see any reason why there would not be serious problems occurring in at least some other Flint homes,” said Edwards.

In 1986, the U.S. Safe Drinking Water Act was amended to prohibit the use of lead pipes in public water systems. Every house built before that is potentially at risk, said Edwards. About half of Flint’s roughly 40,000 homes are at least 50 years old.

Making things worse is the fact that the high levels of chlorine being used to treat Flint’s dirty river water lead to the creation of a carcinogenic byproduct know as total trihalomethanes, or TTHM. To keep TTHM levels down, the city is adding ferric chloride. The trouble is, that additive can also accelerate the corrosion of lead and iron pipes.

Adding yet another layer to the problem is something the city is not doing.

According to Del Toral, Flint should be adding corrosion-control chemicals designed to help keep lead and copper in pipes from leaching into drinking water. Doing so is required by federal regulations, wrote Del Toral in his memo.

“To our knowledge, that is inaccurate,” said Flint spokesman Lorenz. “Before the plant was placed in operation, the City (and our engineering firm) had numerous discussions with DEQ personnel and inquired if corrosion-control chemicals – typically phosphates -- needed to be included in the treatment process. The use of these chemicals was not required or mandated.”

What’s indisputable is this:

Flint’s water contained corrosion-control chemicals until April 2014, when Flint’s ties to the Detroit water system were severed. Flint officials hailed that changeover as a cost-cutting move for a city facing a financial crisis so severe it had been placed under the control of a state-appointed emergency manager.

Discontinuing the use of the anti-corrosion chemicals allowed toxic scale built up on the insides of pipes over the past decades to be released into water flowing into people's homes, explained Del Toral.

In his memo, Del Toral warned: "The lack of mitigating treatment is especially concerning as the high lead levels [that result] will likely not be reflected in the City of Flint's compliance samples due to sampling procedures used…"

In other words, at the same time the city is exacerbating the problem, it's conducting tests that will probably fail to identify the true extent of the threat.

Del Toral described the situation as a "major concern."

"In the absence of any corrosion control treatment, lead levels in drinking water can be expected to increase," he warned in his memo.

The EPA offered Flint officials the use of agency experts to help get the situation under control, said Del Toral, but added that, to his knowledge, the city has so far declined all help.

LeeAnne Walters said that when she asked why city officials weren't taking the EPA's offer of assistance, she was told, "We don't need it."

Flint spokesman Lorenz, on the other hand, maintained that "the city continues to work closely with the MDEQ and the EPA Regional Office."

As for Walters's family, that the city has finally replaced the service line leading to their home, and lead levels have dropped below the 15 ppb EPA action level.

The problem now, she said, is that water currently coming out of her tap tinged yellow and smells of rotten eggs. City officials have given her no explanation as to the possible cause of that.

It is just one more in a long list of questions that need to be addressed.

"What we need," said Walters, "are more answers."

But it's not just answers the people of Flint require.

They also need solutions. And, as Del Toral's EPA memo emphasizes, they need them immediately.

Subject: RE: Flint Discussion

Rita--you asked at our July 1 meeting that we provide you with any comments related to your write-up to summarize this situation with Flint, or from our meeting.

I had a discussion with Miguel earlier this week, and it seems more apparent that Flint may have violated the LCR by not maintaining corrosion control after being optimized back in the early 1990's (since they were a customer of Detroit). MDEQ did not tell Flint to maintain corrosion control; instead, they treated the change in source water as a new system. I'll bet that the State will take this personally since they are responsible for the City of Flint's actions; which isn't a bad thing, but they may get VERY defensive. We can get into the weeds and explain in detail the intent of the rule and our interpretation of the rule and why the State must issue a TT violation, but in the end; the City, the State and we must move forward TOGETHER to correct this problem. We have resources in Mike Schock and Darren Lytle and Mike Wright; and we want to work with the State and the City to address ALL of the contaminant issues going on in Flint; bacti, TTHMs, Legionella, lead--from a wholistic approach to get some form of corrosion control working that doesn't minimize treatment for bacti or TTHMs. It doesn't make sense to discuss with the State what happened in the past; we need to move forward and work with the State as our partner; as the State sees the lead levels climbing, I don't see the benefit in rubbing their nose in the fact that we're right, and they're wrong.

If the State/City agree to issue public education on how citizens must properly flush their taps, I'm wondering what the benefit would be to force the State to issue a TT violation to Flint.

Regarding the State's protocol of pre-flushing, Miguel said earlier this week on the phone with me that pre-flushing didn't really make that much difference in the lead levels when the City was using Detroit water, since there was scale existing on the inside of the lead pipes. Now that the scale appears to be disappearing, the lead levels are starting to rise even with pre-flushing being conducted prior to sampling. Yes, the levels would probably be higher without the pre-flushing, but the City may exceed the Action Level even with the pre-flushing. Maybe the issue of the State's use of pre-flushing is moot at this point; perhaps we need to focus our energy on getting the State and City to accept our offer of Darren and Mike's participation in a wholistic approach to starting corrosion control and implementing public education for lead.

Subject: RE: Flint Discussion

I have been trying to wrap by brain around all the Flint issues and developed the attached summary that I thought I'd share for the meeting. Our objective for the meeting is to discuss the status of Flint, what are all the current issues are, and to all agree on next steps and messaging. If you have other objectives for the meeting please bring those up first thing at the meeting.

Thanks so much. For completeness, where were the 2nd and 3rd samples sent for analysis? Also, thanks for the background on your relationship with Marc Edwards, but I believe Tim is asking do we have any contractual relationship with VA Tech. Did we ask Marc to analyze the samples on our behalf or did Marc volunteer. That should complete what Tim is looking for.

Subject: Re: One more water question

Hi Rita,

There were four sets of diagnostic (sequential) samples were collected as follows:

- 1st set: Samples collected by Citizen name / Ex. 6 and sent to VT, per request from Citizen name / Ex. 6 Citizen name / Ex. 6 to Dr. Marc Edwards at VT.
- 2nd & 3rd sets: Samples were collected by myself at two residents drawing from the same water main as the Citizen name / Ex. 6 s. The sampling instructions and protocol used was the same as in the Chicago study. No formal QAPP was developed for these samples. The sampling and analytical procedure were the same as what the region approved for the Chicago study.
- 4th set: Collected by Citizen name / Ex. 6 shipped to and analyzed by EPA CRL following the replacement of the Walters' service line.

All pipe samples: All work has been done by VT on behalf of Citizen name / Ex. 6

Regarding the EPA/VT connection...Dr. Edwards has conducted extensive research on lead in drinking water, corrosion and corrosion control. He and I and Mike Schock discuss lead in drinking water, corrosion and corrosion control issues from time to time to evaluate the latest published research relevant to EPA's work on the upcoming LCR revisions. Dr. Edwards is an internationally recognized expert in the area of corrosion and corrosion controland served as a technical resource for the NDWAC LCR WG. With Citizen name / Ex. 6 permission, Dr. Edwards has shared the data/information from his work with Citizen name / Ex. 6 with EPA R5.

Hope that helps clarify things.

Subject: FW: One more water question

Miguel, First, please don't shoot the messenger. Can you provide me with a response to Tim's questions below? I told Tim that I did not believe we developed a QAPP for Flint sampling, but needed you to confirm that. I'm also not sure if you personally took the samples or not and if that makes a difference for when a QAPP is needed, but his position is that if EPA is using data that we collected for a written report that we need a QAPP. Questions are also being raised about the role of and relationship we have with VA Tech and why were they analyzing drinking water samples and pipe segments. Any information you can provide to answer those questions would be greatly appreciated.

Can you please get me the QAPP that covers the sampling/analysis described in the interim report Miguel drafted for Tom? Likewise, any agreement including QAPP between EPA and VA Tech, which according to the interim report did some of the analyses.

Those numbers filled her with dread, because they meant her family had been exposed to high levels of a terribly toxic heavy metal that put her children's future in jeopardy.

But it was the result of a third test of the tap water in her home, performed by independent experts at Virginia Tech university, that most stunned Walters.

"It took a while for me to wrap my head around it," said Walters.

The VT researchers discovered lead levels in Walters' water reached a jaw-dropping 13,200 ppb—more than twice the amount at which the U.S. Environmental Protection Agency classifies water as hazardous waste.

"When I saw those numbers I was shocked," said Virginia Tech professor Marc Edwards, a former MacArthur Fellow and respected authority on corrosion in drinking-water systems, who oversaw the tests.

Edwards played a key role in discovering the problem of corroded water pipes and lead in Washington, D.C. drinking water during the early 2000s, in what has been described as one of the worst contamination events ever seen in an urban water system, with resulting increased incidence of childhood lead poisoning, miscarriages and fetal death.

In terms of lead levels, the Walters family's numbers eclipsed even the worst D.C. homes.

"I have never in my 25-year career seen such outrageously high levels going into another home in the United States," said Edwards. "This was literally hazardous-waste levels."

But the condition of Walters' tap water raises a much more far-reaching question: Since the city moved away from Detroit's water system and began pumping water from the Flint River, how many other families have been put at risk by the city's questionable testing procedures and handling of the water supply?

The Walters family surely isn't alone in dealing with the threat of lead-laced drinking water. About half of Flint's 40,000 homes are a half-century old or older, built at a time when water service lines were typically made of lead.

And according to various experts, including an EPA water-quality specialist, the city's actions are only exacerbating the threat.

"What the public needs is accurate information," explained Miguel Del Toral, regulations manager for the Ground Water and Drinking Water Branch of the EPA's Region 5.

Instead, the city is utilizing testing measures that almost ensure that worst-case scenarios such as the one facing the Walters family escape detection, asserted Del Toral in an internal EPA memo provided to the ACLU of Michigan.

Compounding the threat is what Del Toral describes as the continued inability of officials to adequately treat water coming into people's homes from the Flint River.

"I don't want to scare people unnecessarily," said Del Toral in a phone interview from his home in Chicago. "But there is absolutely a problem in Flint that needs to be addressed right away."

During his interview with the ACLU of Michigan, Del Toral said he was willing to go on the record with his concerns, but that he was doing so as a private citizen, not as a representative of the EPA.

EPA rules, he said, required that such interviews be routed through the agency's public affairs people. But he's willing to speak out nonetheless, he said, because of the potential harm to the public is so great, and the need to address it is so urgent.

WATERING DOWN THE TESTS

Perhaps the most vexing problem in all of this is the contamination caused by the city's decades-old network of lead and iron pipes—a problem directly connected to the switch to river water, and the city's failure to adequately treat it.

Under the U.S. Environmental Protection Agency's rules, if lead reaches a level of 15 parts per billion in water, the source of the problem must be identified and corrected.

In early March, after months of requests (and only after Walters had received a doctor's note raising concerns about problems with the water), the city finally conducted a test. It found lead levels of 104 ppb the first time. A second test recorded a level of 397 ppb.

Blood tests, taken after those water-sample numbers were reported, revealed that one of her children, a four year old, had lead poisoning.

The news was devastating, said Walters, and the concern it creates for her child's future is haunting.

"Lead can affect almost every organ and system in your body," according to the EPA's web site. "Children six years old and younger are most susceptible … Even low levels of lead in the blood of children can result in: behavior and learning problems; lower IQ and hyperactivity; slowed growth; and hearing problems."

Those dangers made Walters all the more determined to get her questions answered.

For one thing, she wanted to know why residents were being instructed to “pre-flush” water lines before drawing samples that would be tested by the city

After much searching, she found Del Toral at the EPA’s Region 5 in Chicago. He explained to her that her instincts were right, and that she had good cause to be concerned about the way testing was being done.

“The practice of pre-flushing before collecting compliance samples has been shown to result in the minimization of lead capture and significant underestimation of lead levels in drinking water,” wrote Del Toral in an internal memo dated June 24.

Del Toral went on to say that the city’s testing methods were a “serious concern” because they “could provide a false sense of security to the residents of Flint regarding lead levels in the water.” As a result, he warned, residents could fail to take the necessary precautions to protect their families from lead in the drinking water.

Virginia Tech’s Edwards completely agrees with Del Toral’s assessment.

“The net effect of a ‘pre-flush’ is to greatly reduce the likelihood of detecting lead in samples collected … that would normally be present in the consumers drinking water,” Edwards wrote in an email. “I have long maintained that the practice should be banned, as it artificially lowers the amount of lead detected in samples versus typical consumer exposure.”

Asked about these concerns, city spokesman Jason Lorenz offered the following email reply: “While I cannot directly respond to Mr. Del Toral's remarks without first contacting the EPA Region 5 office, I can say that the City of Flint follows all the testing procedures and schedules as required by the U.S. EPA.”

He added that the Michigan Department of Environmental Quality (MDEQ) endorses the city's sampling method. The MDEQ did not respond to phone calls and e-mails seeking its comments on the controversy.

Del Toral contended in an interview that what Flint's doing is actually exploiting a "loophole" in the law.

"From a technical standpoint, there's no justification for the way Flint is conducting its tests," Del Toral said. "Any credible scientist will tell you [the city's] method is not the way to catch worst-case conditions."

There is no legitimate reason for the city's methodology, said Del Toral.

EPA rules, he said, required that such interviews be routed through the agency's public affairs people. But he was willing to speak out nonetheless, he said, because of the potential harm to the public.

FLUSHING OUT REAL ANSWERS

It was Del Toral who, after determining that the lead problem plaguing the Walters family was coming from outside their home, connected LeeAnne with Edwards at Virginia Tech.

Instead of taking a single sample after a line had been "pre-flushed" under the city's direction, Edwards instructed Walters to collect a series of samples from water that had been allowed to sit in the service line long enough to accurately reflect levels the family could be exposed to under normal use.

(Meanwhile, that same service line, dug up and replaced after the sample collection, was found to be made of lead in one section and iron in another.)

Edwards tested the water and discovered that the lead contamination ranged from 200 ppb to the 13,200 ppb figure that stunned LeeAnne Walters—and should likewise shock many others.

Given the age of much of Flint's infrastructure, Edwards agrees with Del Toral's assessment that the test results they found at the Walters home amount to an alarm going off, and others in the city need to pay attention.

“I do not see any reason why there would not be serious problems occurring in at least some other Flint homes,” said Edwards.

In 1986, the U.S. Safe Drinking Water Act was amended to prohibit the use of lead pipes in public water systems. Every house built before that is potentially at risk, said Edwards. About half of Flint's roughly 40,000 homes are at least 50 years old.

Making things worse is the fact that the high levels of chlorine being used to treat Flint's dirty river water lead to the creation of a carcinogenic byproduct know as total trihalomethanes, or TTHM. To keep TTHM levels down, the city is adding ferric chloride. The trouble is, that additive can also accelerate the corrosion of lead and iron pipes.

Adding yet another layer to the problem is something the city is not doing.

According to Del Toral, Flint should be adding corrosion-control chemicals designed to help keep lead and copper in pipes from leaching into drinking water. Doing so is required by federal regulations, wrote Del Toral in his memo.

“To our knowledge, that is inaccurate,” said Flint spokesman Lorenz. “Before the plant was placed in operation, the City (and our engineering firm) had numerous discussions with DEQ personnel and inquired if corrosion-control chemicals – typically phosphates --needed to be included in the treatment process. The use of these chemicals was not required or mandated.”

What’s indisputable is this:

Flint’s water contained corrosion-control chemicals until April 2014, when Flint’s ties to the Detroit water system were severed. Flint officials hailed that changeover as a cost-cutting move for a city facing a financial crisis so severe it had been placed under the control of a state-appointed emergency manager.

Discontinuing the use of the anti-corrosion chemicals allowed toxic scale built up on the insides of pipes over the past decades to be released into water flowing into people’s homes, explained Del Toral.

In his memo, Del Toral warned: “The lack of mitigating treatment is especially concerning as the high lead levels [that result] will likely not be reflected in the City of Flint’s compliance samples due to sampling procedures used…”

In other words, at the same time the city is exacerbating the problem, it’s conducting tests that will probably fail to identify the true extent of the threat.

Del Toral described the situation as a “major concern.”

“In the absence of any corrosion control treatment, lead levels in drinking water can be expected to increase,” he warned in his memo.

The EPA offered Flint officials the use of agency experts to help get the situation under control, said Del Toral, but added that, to his knowledge, the city has so far declined all help.

LeeAnne Walters said that when she asked why city officials weren't taking the EPA's offer of assistance, she was told, "We don't need it."

Flint spokesman Lorenz, on the other hand, maintained that "the city continues to work closely with the MDEQ and the EPA Regional Office."

As for Walters's family, that the city has finally replaced the service line leading to their home, and lead levels have dropped below the 15 ppb EPA action level.

The problem now, she said, is that water currently coming out of her tap tinged yellow and smells of rotten eggs. City officials have given her no explanation as to the possible cause of that.

It is just one more in a long list of questions that need to be addressed.

"What we need," said Walters, "are more answers."

But it's not just answers the people of Flint require.

They also need solutions. And, as Del Toral's EPA memo emphasizes, they need them immediately.

Jul 09 Posted by Curt Guyette in Democracy Watch

It took a while for LeeAnne Walters to realize the full impact of the number: 13,200.

Walters—a stay-at home mom with four sons and a husband in the Navy—had seen other numbers reflecting the quality of drinking water at her Flint home that were devastating. But 13,200? She'd never seen anything like this.

The city had tested her water twice in this past March and both times found dangerously high levels of lead—104 parts per billion (ppb) and 397 ppb, respectively.

Those numbers filled her with dread, because they meant her family had been exposed to high levels of a terribly toxic heavy metal that put her children's future in jeopardy.

But it was the result of a third test of the tap water in her home, performed by independent experts at Virginia Tech university, that most stunned Walters.

"It took a while for me to wrap my head around it," said Walters.

The VT researchers discovered lead levels in Walters' water reached a jaw-dropping 13,200 ppb—more than twice the amount at which the U.S. Environmental Protection Agency classifies water as hazardous waste.

"When I saw those numbers I was shocked," said Virginia Tech professor Marc

Edwards, a former MacArthur Fellow and respected authority on corrosion in drinking-water systems, who oversaw the tests.

Edwards played a key role in discovering the problem of corroded water pipes and lead in Washington, D.C. drinking water during the early 2000s, in what has been described as one of the worst contamination events ever seen in an urban water system, with resulting increased incidence of childhood lead poisoning, miscarriages and fetal death.

In terms of lead levels, the Walters family's numbers eclipsed even the worst D.C. homes.

"I have never in my 25-year career seen such outrageously high levels going into another home in the United States," said Edwards. "This was literally hazardous-waste levels."

But the condition of Walters' tap water raises a much more far-reaching question: Since the city moved away from Detroit's water system and began pumping water from the Flint River, how many other families have been put at risk by the city's questionable testing procedures and handling of the water supply?

The Walters family surely isn't alone in dealing with the threat of lead-laced drinking water. About half of Flint's 40,000 homes are a half-century old or older, built at a time when water service lines were typically made of lead.

And according to various experts, including an EPA water-quality specialist, the city's actions are only exacerbating the threat.

"What the public needs is accurate information," explained Miguel Del Toral, regulations manager for the Ground Water and Drinking Water Branch of the EPA's Region 5.

Instead, the city is utilizing testing measures that almost ensure that worst-case scenarios such as the one facing the Walters family escape detection, asserted Del Toral in an internal EPA memo provided to the ACLU of Michigan.

Compounding the threat is what Del Toral describes as the continued inability of officials to adequately treat water coming into people's homes from the Flint River.

"I don't want to scare people unnecessarily," said Del Toral in a phone interview from his home in Chicago. "But there is absolutely a problem in Flint that needs to be addressed right away."

During his interview with the ACLU of Michigan, Del Toral said he was willing to go on the record with his concerns, but that he was doing so as a private citizen, not as a representative of the EPA.

EPA rules, he said, required that such interviews be routed through the agency's public affairs people. But he's willing to speak out nonetheless, he said, because of the potential harm to the public is so great, and the need to address it is so urgent.

WATERING DOWN THE TESTS

Perhaps the most vexing problem in all of this is the contamination caused by the city's decades-old network of lead and iron pipes—a problem directly connected to the switch to river water, and the city's failure to adequately treat it.

Under the U.S. Environmental Protection Agency's rules, if lead reaches a level of 15 parts per billion in water, the source of the problem must be identified and corrected.

In early March, after months of requests (and only after Walters had received a doctor's note raising concerns about problems with the water), the city finally conducted a test. It found lead levels of 104 ppb the first time. A second test recorded a level of 397 ppb.

Blood tests, taken after those water-sample numbers were reported, revealed that one of her children, a four year old, had lead poisoning.

The news was devastating, said Walters, and the concern it creates for her child's future is haunting.

"Lead can affect almost every organ and system in your body," according to the EPA's web site. "Children six years old and younger are most susceptible … Even low levels of lead in the blood of children can result in: behavior and learning problems; lower IQ and hyperactivity; slowed growth; and hearing problems."

Those dangers made Walters all the more determined to get her questions answered.

For one thing, she wanted to know why residents were being instructed to "pre-flush" water lines before drawing samples that would be tested by the city

After much searching, she found Del Toral at the EPA's Region 5 in Chicago. He explained to her that her instincts were right, and that she had good cause to be concerned about the way testing was being done.

"The practice of pre-flushing before collecting compliance samples has been shown to result in the minimization of lead capture and significant underestimation of lead levels in drinking water," wrote Del Toral in an internal memo dated June 24.

Del Toral went on to say that the city's testing methods were a "serious concern" because they "could provide a false sense of security to the residents of Flint regarding lead levels in the water." As a result, he warned, residents could fail to take the necessary precautions to protect their families from lead in the drinking water.

Virginia Tech's Edwards completely agrees with Del Toral's assessment.

"The net effect of a 'pre-flush' is to greatly reduce the likelihood of detecting lead in samples collected … that would normally be present in the consumers drinking water," Edwards wrote in an email. "I have long maintained that the practice should be banned, as it artificially lowers the amount of lead detected in samples versus typical consumer exposure."

Asked about these concerns, city spokesman Jason Lorenz offered the following email reply: "While I cannot directly respond to Mr. Del Toral's remarks without first contacting the EPA Region 5 office, I can say that the City of Flint follows all the testing procedures and schedules as required by the U.S. EPA."

He added that the Michigan Department of Environmental Quality (MDEQ) endorses the city's sampling method. The MDEQ did not respond to phone calls and e-mails seeking its comments on the controversy.

Del Toral contended in an interview that what Flint's doing is actually exploiting a "loophole" in the law.

"From a technical standpoint, there's no justification for the way Flint is conducting its tests," Del Toral said. "Any credible scientist will tell you [the city's] method is not the way to catch worst-case conditions."

There is no legitimate reason for the city's methodology, said Del Toral.

EPA rules, he said, required that such interviews be routed through the agency's public affairs people. But he was willing to speak out nonetheless, he said, because of the potential harm to the public.

FLUSHING OUT REAL ANSWERS

It was Del Toral who, after determining that the lead problem plaguing the Walters family was coming from outside their home, connected LeeAnne with Edwards at Virginia Tech.

Instead of taking a single sample after a line had been "pre-flushed" under the city's direction, Edwards instructed Walters to collect a series of samples from water that had been allowed to sit in the service line long enough to accurately reflect levels the family could be exposed to under normal use.

(Meanwhile, that same service line, dug up and replaced after the sample collection, was found to be made of lead in one section and iron in another.)

Edwards tested the water and discovered that the lead contamination ranged from 200 ppb to the 13,200 ppb figure that stunned LeeAnne Walters—and should likewise shock many others.

Given the age of much of Flint's infrastructure, Edwards agrees with Del Toral's assessment that the test results they found at the Walters home amount to an alarm going off, and others in the city need to pay attention.

“I do not see any reason why there would not be serious problems occurring in at least some other Flint homes,” said Edwards.

In 1986, the U.S. Safe Drinking Water Act was amended to prohibit the use of lead pipes in public water systems. Every house built before that is potentially at risk, said Edwards. About half of Flint’s roughly 40,000 homes are at least 50 years old.

Making things worse is the fact that the high levels of chlorine being used to treat Flint’s dirty river water lead to the creation of a carcinogenic byproduct know as total trihalomethanes, or TTHM. To keep TTHM levels down, the city is adding ferric chloride. The trouble is, that additive can also accelerate the corrosion of lead and iron pipes.

Adding yet another layer to the problem is something the city is not doing.

According to Del Toral, Flint should be adding corrosion-control chemicals designed to help keep lead and copper in pipes from leaching into drinking water. Doing so is required by federal regulations, wrote Del Toral in his memo.

“To our knowledge, that is inaccurate,” said Flint spokesman Lorenz. “Before the plant was placed in operation, the City (and our engineering firm) had numerous discussions with DEQ personnel and inquired if corrosion-control chemicals – typically phosphates --needed to be included in the treatment process. The use of these chemicals was not required or mandated.”

What’s indisputable is this:

Flint’s water contained corrosion-control chemicals until April 2014, when Flint’s ties to the Detroit water system were severed. Flint officials hailed that changeover as a cost-cutting move for a city facing a financial crisis so severe it had been placed under the control of a state-appointed emergency manager.

Discontinuing the use of the anti-corrosion chemicals allowed toxic scale built up on the insides of pipes over the past decades to be released into water flowing into people's homes, explained Del Toral.

In his memo, Del Toral warned: "The lack of mitigating treatment is especially concerning as the high lead levels [that result] will likely not be reflected in the City of Flint's compliance samples due to sampling procedures used…"

In other words, at the same time the city is exacerbating the problem, it's conducting tests that will probably fail to identify the true extent of the threat.

Del Toral described the situation as a "major concern."

"In the absence of any corrosion control treatment, lead levels in drinking water can be expected to increase," he warned in his memo.

The EPA offered Flint officials the use of agency experts to help get the situation under control, said Del Toral, but added that, to his knowledge, the city has so far declined all help.

LeeAnne Walters said that when she asked why city officials weren't taking the EPA's offer of assistance, she was told, "We don't need it."

Flint spokesman Lorenz, on the other hand, maintained that "the city continues to work closely with the MDEQ and the EPA Regional Office."

As for Walters's family, that the city has finally replaced the service line leading to their home, and lead levels have dropped below the 15 ppb EPA action level.

The problem now, she said, is that water currently coming out of her tap tinged yellow and smells of rotten eggs. City officials have given her no explanation as to the possible cause of that.

It is just one more in a long list of questions that need to be addressed.

“What we need,” said Walters, “are more answers.”

But it’s not just answers the people of Flint require.

They also need solutions. And, as Del Toral’s EPA memo emphasizes, they need them immediately.

Corrosive Impact: Leaded Water and One Flint Family's Toxic Nightmare

Jul 09 Posted by Curt Guyette in Democracy Watch

It took a while for LeeAnne Walters to realize the full impact of the number: 13,200.

Walters—a stay-at home mom with four sons and a husband in the Navy—had seen other numbers reflecting the quality of drinking water at her Flint home that were devastating. But 13,200? She'd never seen anything like this.

The city had tested her water twice in this past March and both times found dangerously high levels of lead—104 parts per billion (ppb) and 397 ppb, respectively.

Those numbers filled her with dread, because they meant her family had been exposed to high levels of a terribly toxic heavy metal that put her children's future in jeopardy.

But it was the result of a third test of the tap water in her home, performed by independent experts at Virginia Tech university, that most stunned Walters.

"It took a while for me to wrap my head around it," said Walters.

The VT researchers discovered lead levels in Walters' water reached a jaw-dropping 13,200 ppb—more than twice the amount at which the U.S. Environmental Protection Agency classifies water as hazardous waste.

"When I saw those numbers I was shocked," said Virginia Tech professor Marc Edwards, a former MacArthur Fellow and respected authority on corrosion in drinking-water systems, who oversaw the tests.

Edwards played a key role in discovering the problem of corroded water pipes and lead in Washington, D.C. drinking water during the early 2000s, in what has been described as one of the worst contamination events ever seen in an urban water system, with resulting increased incidence of childhood lead poisoning, miscarriages and fetal death.

In terms of lead levels, the Walters family's numbers eclipsed even the worst D.C. homes.

"I have never in my 25-year career seen such outrageously high levels going into another home in the United States," said Edwards. "This was literally hazardous-waste levels."

But the condition of Walters' tap water raises a much more far-reaching question: Since the city moved away from Detroit's water system and began pumping water from the Flint River, how many other families have been put at risk by the city's questionable testing procedures and handling of the water supply?

The Walters family surely isn't alone in dealing with the threat of lead-laced drinking water. About half of Flint's 40,000 homes are a half-century old or older, built at a time when water service lines were typically made of lead.

And according to various experts, including an EPA water-quality specialist, the city's actions are only exacerbating the threat.

"What the public needs is accurate information," explained Miguel Del Toral, regulations manager for the Ground Water and Drinking Water Branch of the EPA's Region 5.

Instead, the city is utilizing testing measures that almost ensure that worst-case scenarios such as the one facing the Walters family escape detection, asserted Del Toral in an internal EPA memo provided to the ACLU of Michigan.

Compounding the threat is what Del Toral describes as the continued inability of officials to adequately treat water coming into people's homes from the Flint River.

"I don't want to scare people unnecessarily," said Del Toral in a phone interview from his home in Chicago. "But there is absolutely a problem in Flint that needs to be addressed right away."

During his interview with the ACLU of Michigan, Del Toral said he was willing to go on the record with his concerns, but that he was doing so as a private citizen, not as a representative of the EPA.

EPA rules, he said, required that such interviews be routed through the agency's public affairs people. But he's willing to speak out nonetheless, he said, because of the potential harm to the public is so great, and the need to address it is so urgent.

WATERING DOWN THE TESTS

Perhaps the most vexing problem in all of this is the contamination caused by the city's decades-old network of lead and iron pipes—a problem directly connected to the switch to river water, and the city's failure to adequately treat it.

Under the U.S. Environmental Protection Agency's rules, if lead reaches a level of 15 parts per billion in water, the source of the problem must be identified and corrected.

In early March, after months of requests (and only after Walters had received a doctor's note raising concerns about problems with the water), the city finally conducted a test. It found lead levels of 104 ppb the first time. A second test recorded a level of 397 ppb.

Blood tests, taken after those water-sample numbers were reported, revealed that one of her children, a four year old, had lead poisoning.

The news was devastating, said Walters, and the concern it creates for her child's future is haunting.

“Lead can affect almost every organ and system in your body,” according to the EPA's web site. “Children six years old and younger are most susceptible … Even low levels of lead in the blood of children can result in: behavior and learning problems; lower IQ and hyperactivity; slowed growth; and hearing problems.”

Those dangers made Walters all the more determined to get her questions answered.

For one thing, she wanted to know why residents were being instructed to “pre-flush” water lines before drawing samples that would be tested by the city

After much searching, she found Del Toral at the EPA's Region 5 in Chicago. He explained to her that her instincts were right, and that she had good cause to be concerned about the way testing was being done.

“The practice of pre-flushing before collecting compliance samples has been shown to result in the minimization of lead capture and significant underestimation of lead levels in drinking water,” wrote Del Toral in an internal memo dated June 24.

Del Toral went on to say that the city's testing methods were a “serious concern” because they “could provide a false sense of security to the residents of Flint regarding lead levels in the water.” As a result, he warned, residents could fail to take the necessary precautions to protect their families from lead in the drinking water.

Virginia Tech's Edwards completely agrees with Del Toral's assessment.

“The net effect of a ‘pre-flush’ is to greatly reduce the likelihood of detecting lead in samples collected … that would normally be present in the consumers drinking water,” Edwards wrote in an email. “I have long maintained that the practice should be banned, as it artificially lowers the amount of lead detected in samples versus typical consumer exposure.”

Asked about these concerns, city spokesman Jason Lorenz offered the following email reply: “While I cannot directly respond to Mr. Del Toral's remarks without first contacting the EPA Region 5 office, I can say that the City of Flint follows all the testing procedures and schedules as required by the U.S. EPA.”

He added that the Michigan Department of Environmental Quality (MDEQ) endorses the city's sampling method. The MDEQ did not respond to phone calls and e-mails seeking its comments on the controversy.

Del Toral contended in an interview that what Flint's doing is actually exploiting a "loophole" in the law.

"From a technical standpoint, there's no justification for the way Flint is conducting its tests," Del Toral said. "Any credible scientist will tell you [the city's] method is not the way to catch worst-case conditions."

There is no legitimate reason for the city's methodology, said Del Toral.

EPA rules, he said, required that such interviews be routed through the agency's public affairs people. But he was willing to speak out nonetheless, he said, because of the potential harm to the public.

FLUSHING OUT REAL ANSWERS

It was Del Toral who, after determining that the lead problem plaguing the Walters family was coming from outside their home, connected LeeAnne with Edwards at Virginia Tech.

Instead of taking a single sample after a line had been "pre-flushed" under the city's direction, Edwards instructed Walters to collect a series of samples from water that had been allowed to sit in the service line long enough to accurately reflect levels the family could be exposed to under normal use.

(Meanwhile, that same service line, dug up and replaced after the sample collection, was found to be made of lead in one section and iron in another.)

Edwards tested the water and discovered that the lead contamination ranged from 200 ppb to the 13,200 ppb figure that stunned LeeAnne Walters—and should likewise shock many others.

Given the age of much of Flint's infrastructure, Edwards agrees with Del Toral's assessment that the test results they found at the Walters home amount to an alarm going off, and others in the city need to pay attention.

"I do not see any reason why there would not be serious problems occurring in at least some other Flint homes," said Edwards.

In 1986, the U.S. Safe Drinking Water Act was amended to prohibit the use of lead pipes in public water systems. Every house built before that is potentially at risk, said Edwards. About half of Flint's roughly 40,000 homes are at least 50 years old.

Making things worse is the fact that the high levels of chlorine being used to treat Flint's dirty river water lead to the creation of a carcinogenic byproduct know as total trihalomethanes, or TTHM. To keep TTHM levels down, the city is adding ferric chloride. The trouble is, that additive can also accelerate the corrosion of lead and iron pipes.

Adding yet another layer to the problem is something the city is not doing.

According to Del Toral, Flint should be adding corrosion-control chemicals designed to help keep lead and copper in pipes from leaching into drinking water. Doing so is required by federal regulations, wrote Del Toral in his memo.

"To our knowledge, that is inaccurate," said Flint spokesman Lorenz. "Before the plant was placed in operation, the City (and our engineering firm) had numerous discussions with DEQ personnel and inquired if corrosion-control chemicals – typically phosphates --needed to be included in the treatment process. The use of these chemicals was not required or mandated."

What's indisputable is this:

Flint's water contained corrosion-control chemicals until April 2014, when Flint's ties to the Detroit water system were severed. Flint officials hailed that changeover as a cost-cutting move for a city facing a financial crisis so severe it had been placed under the control of a state-appointed emergency manager.

Discontinuing the use of the anti-corrosion chemicals allowed toxic scale built up on the insides of pipes over the past decades to be released into water flowing into people's homes, explained Del Toral.

In his memo, Del Toral warned: "The lack of mitigating treatment is especially concerning as the high lead levels [that result] will likely not be reflected in the City of Flint's compliance samples due to sampling procedures used…"

In other words, at the same time the city is exacerbating the problem, it's conducting tests that will probably fail to identify the true extent of the threat.

Del Toral described the situation as a "major concern."

"In the absence of any corrosion control treatment, lead levels in drinking water can be expected to increase," he warned in his memo.

The EPA offered Flint officials the use of agency experts to help get the situation under control, said Del Toral, but added that, to his knowledge, the city has so far declined all help.

LeeAnne Walters said that when she asked why city officials weren't taking the EPA's offer of assistance, she was told, "We don't need it."

Flint spokesman Lorenz, on the other hand, maintained that "the city continues to work closely with the MDEQ and the EPA Regional Office."

As for Walters's family, that the city has finally replaced the service line leading to their home, and lead levels have dropped below the 15 ppb EPA action level.

The problem now, she said, is that water currently coming out of her tap tinged yellow and smells of rotten eggs. City officials have given her no explanation as to the possible cause of that.

It is just one more in a long list of questions that need to be addressed.

"What we need," said Walters, "are more answers."

But it's not just answers the people of Flint require.

They also need solutions. And, as Del Toral's EPA memo emphasizes, they need them immediately.

Corrosive Impact: Leaded Water and One Flint Family's Toxic Nightmare

Jul 09 Posted by Curt Guyette in Democracy Watch

It took a while for LeeAnne Walters to realize the full impact of the number: 13,200.

Walters—a stay-at home mom with four sons and a husband in the Navy—had seen other numbers reflecting the quality of drinking water at her Flint home that were devastating. But 13,200? She'd never seen anything like this.

The city had tested her water twice in this past March and both times found dangerously high levels of lead—104 parts per billion (ppb) and 397 ppb, respectively.

Those numbers filled her with dread, because they meant her family had been exposed to high levels of a terribly toxic heavy metal that put her children's future in jeopardy.

But it was the result of a third test of the tap water in her home, performed by independent experts at Virginia Tech university, that most stunned Walters.

"It took a while for me to wrap my head around it," said Walters.

The VT researchers discovered lead levels in Walters' water reached a jaw-dropping 13,200 ppb—more than twice the amount at which the U.S. Environmental Protection Agency classifies water as hazardous waste.

“When I saw those numbers I was shocked,” said Virginia Tech professor Marc Edwards, a former MacArthur Fellow and respected authority on corrosion in drinking-water systems, who oversaw the tests.

Edwards played a key role in discovering the problem of corroded water pipes and lead in Washington, D.C. drinking water during the early 2000s, in what has been described as one of the worst contamination events ever seen in an urban water system, with resulting increased incidence of childhood lead poisoning, miscarriages and fetal death.

In terms of lead levels, the Walters family’s numbers eclipsed even the worst D.C. homes.

“I have never in my 25-year career seen such outrageously high levels going into another home in the United States,” said Edwards. “This was literally hazardous-waste levels.”

But the condition of Walters’ tap water raises a much more far-reaching question: Since the city moved away from Detroit’s water system and began pumping water from the Flint River, how many other families have been put at risk by the city’s questionable testing procedures and handling of the water supply?

The Walters family surely isn’t alone in dealing with the threat of lead-laced drinking water. About half of Flint’s 40,000 homes are a half-century old or older, built at a time when water service lines were typically made of lead.

And according to various experts, including an EPA water-quality specialist, the city’s actions are only exacerbating the threat.

“What the public needs is accurate information,” explained Miguel Del Toral, regulations manager for the Ground Water and Drinking Water Branch of the EPA’s Region 5.

Instead, the city is utilizing testing measures that almost ensure that worst-case scenarios such as the one facing the Walters family escape detection, asserted Del Toral in an internal EPA memo provided to the ACLU of Michigan.

Compounding the threat is what Del Toral describes as the continued inability of officials to adequately treat water coming into people’s homes from the Flint River.

“I don’t want to scare people unnecessarily,” said Del Toral in a phone interview from his home in Chicago. “But there is absolutely a problem in Flint that needs to be addressed right away.”

During his interview with the ACLU of Michigan, Del Toral said he was willing to go on the record with his concerns, but that he was doing so as a private citizen, not as a representative of the EPA.

EPA rules, he said, required that such interviews be routed through the agency’s public affairs people. But he’s willing to speak out nonetheless, he said, because of the potential harm to the public is so great, and the need to address it is so urgent.

WATERING DOWN THE TESTS

Perhaps the most vexing problem in all of this is the contamination caused by the city’s decades-old network of lead and iron pipes—a problem directly connected to the switch to river water, and the city’s failure to adequately treat it.

Under the U.S. Environmental Protection Agency's rules, if lead reaches a level of 15 parts per billion in water, the source of the problem must be identified and corrected.

In early March, after months of requests (and only after Walters had received a doctor's note raising concerns about problems with the water), the city finally conducted a test. It found lead levels of 104 ppb the first time. A second test recorded a level of 397 ppb.

Blood tests, taken after those water-sample numbers were reported, revealed that one of her children, a four year old, had lead poisoning.

The news was devastating, said Walters, and the concern it creates for her child's future is haunting.

"Lead can affect almost every organ and system in your body," according to the EPA's web site. "Children six years old and younger are most susceptible … Even low levels of lead in the blood of children can result in: behavior and learning problems; lower IQ and hyperactivity; slowed growth; and hearing problems."

Those dangers made Walters all the more determined to get her questions answered.

For one thing, she wanted to know why residents were being instructed to "pre-flush" water lines before drawing samples that would be tested by the city

After much searching, she found Del Toral at the EPA's Region 5 in Chicago. He explained to her that her instincts were right, and that she had good cause to be concerned about the way testing was being done.

“The practice of pre-flushing before collecting compliance samples has been shown to result in the minimization of lead capture and significant underestimation of lead levels in drinking water,” wrote Del Toral in an internal memo dated June 24.

Del Toral went on to say that the city’s testing methods were a “serious concern” because they “could provide a false sense of security to the residents of Flint regarding lead levels in the water.” As a result, he warned, residents could fail to take the necessary precautions to protect their families from lead in the drinking water.

Virginia Tech’s Edwards completely agrees with Del Toral’s assessment.

“The net effect of a ‘pre-flush’ is to greatly reduce the likelihood of detecting lead in samples collected … that would normally be present in the consumers drinking water,” Edwards wrote in an email. “I have long maintained that the practice should be banned, as it artificially lowers the amount of lead detected in samples versus typical consumer exposure.”

Asked about these concerns, city spokesman Jason Lorenz offered the following email reply: “While I cannot directly respond to Mr. Del Toral's remarks without first contacting the EPA Region 5 office, I can say that the City of Flint follows all the testing procedures and schedules as required by the U.S. EPA.”

He added that the Michigan Department of Environmental Quality (MDEQ) endorses the city’s sampling method. The MDEQ did not respond to phone calls and e-mails seeking its comments on the controversy.

Del Toral contended in an interview that what Flint’s doing is actually exploiting a “loophole” in the law.

“From a technical standpoint, there’s no justification for the way Flint is conducting its tests,” Del Toral said. “Any credible scientist will tell you [the city’s] method is not the way to catch worst-case conditions.”

There is no legitimate reason for the city’s methodology, said Del Toral.

EPA rules, he said, required that such interviews be routed through the agency’s public affairs people. But he was willing to speak out nonetheless, he said, because of the potential harm to the public.

FLUSHING OUT REAL ANSWERS

It was Del Toral who, after determining that the lead problem plaguing the Walters family was coming from outside their home, connected LeeAnne with Edwards at Virginia Tech.

Instead of taking a single sample after a line had been “pre-flushed” under the city’s direction, Edwards instructed Walters to collect a series of samples from water that had been allowed to sit in the service line long enough to accurately reflect levels the family could be exposed to under normal use.

(Meanwhile, that same service line, dug up and replaced after the sample collection, was found to be made of lead in one section and iron in another.)

Edwards tested the water and discovered that the lead contamination ranged from 200 ppb to the 13,200 ppb figure that stunned LeeAnne Walters—and should likewise shock many others.

Given the age of much of Flint’s infrastructure, Edwards agrees with Del Toral’s assessment that the test results they found at the Walters home amount to an alarm going off, and others in the city need to pay attention.

“I do not see any reason why there would not be serious problems occurring in at least some other Flint homes,” said Edwards.

In 1986, the U.S. Safe Drinking Water Act was amended to prohibit the use of lead pipes in public water systems. Every house built before that is potentially at risk, said Edwards. About half of Flint’s roughly 40,000 homes are at least 50 years old.

Making things worse is the fact that the high levels of chlorine being used to treat Flint’s dirty river water lead to the creation of a carcinogenic byproduct know as total trihalomethanes, or TTHM. To keep TTHM levels down, the city is adding ferric chloride. The trouble is, that additive can also accelerate the corrosion of lead and iron pipes.

Adding yet another layer to the problem is something the city is not doing.

According to Del Toral, Flint should be adding corrosion-control chemicals designed to help keep lead and copper in pipes from leaching into drinking water. Doing so is required by federal regulations, wrote Del Toral in his memo.

“To our knowledge, that is inaccurate,” said Flint spokesman Lorenz. “Before the plant was placed in operation, the City (and our engineering firm) had numerous discussions with DEQ personnel and inquired if corrosion-control chemicals – typically phosphates --needed to be included in the treatment process. The use of these chemicals was not required or mandated.”

What’s indisputable is this:

Flint’s water contained corrosion-control chemicals until April 2014, when

Flint's ties to the Detroit water system were severed. Flint officials hailed that changeover as a cost-cutting move for a city facing a financial crisis so severe it had been placed under the control of a state-appointed emergency manager.

Discontinuing the use of the anti-corrosion chemicals allowed toxic scale built up on the insides of pipes over the past decades to be released into water flowing into people's homes, explained Del Toral.

In his memo, Del Toral warned: "The lack of mitigating treatment is especially concerning as the high lead levels [that result] will likely not be reflected in the City of Flint's compliance samples due to sampling procedures used…"

In other words, at the same time the city is exacerbating the problem, it's conducting tests that will probably fail to identify the true extent of the threat.

Del Toral described the situation as a "major concern."

"In the absence of any corrosion control treatment, lead levels in drinking water can be expected to increase," he warned in his memo.

The EPA offered Flint officials the use of agency experts to help get the situation under control, said Del Toral, but added that, to his knowledge, the city has so far declined all help.

LeeAnne Walters said that when she asked why city officials weren't taking the EPA's offer of assistance, she was told, "We don't need it."

Flint spokesman Lorenz, on the other hand, maintained that "the city continues to work closely with the MDEQ and the EPA Regional Office."

As for Walters's family, that the city has finally replaced the service line leading to their home, and lead levels have dropped below the 15 ppb EPA action level.

The problem now, she said, is that water currently coming out of her tap tinged yellow and smells of rotten eggs. City officials have given her no explanation as to the possible cause of that.

It is just one more in a long list of questions that need to be addressed.

“What we need,” said Walters, “are more answers.”

But it's not just answers the people of Flint require.

They also need solutions. And, as Del Toral's EPA memo emphasizes, they need them immediately.

Thanks so much. For completeness, where were the 2nd and 3rd samples sent for analysis? Also, thanks for the background on your relationship with Marc Edwards, but I believe Tim is asking do we have any contractual relationship with VA Tech. Did we ask Marc to analyze the samples on our behalf or did Marc volunteer. That should complete what Tim is looking for.

Subject: Re: One more water question

Hi Rita,

There were four sets of diagnostic (sequential) samples were collected as follows:

- 1st set: Samples collected by Citizen name / Ex. 6 and sent to VT, per request from Citizen name / Ex. 6 Citizen name / Ex. 6 Dr. Marc Edwards at VT.
- 2nd & 3rd sets: Samples were collected by myself at two residents drawing from the same water main as the Citizen name / Ex. 6 The sampling instructions and protocol used was the same as in the Chicago study. No formal QAPP was developed for these samples. The sampling and analytical procedure were the same as what the region approved for the Chicago study.
- 4th set: Collected by Citizen name / Ex. 6 shipped to and analyzed by EPA CRL following the replacement of the Citizen name / Ex. 6 service line.

All pipe samples: All work has been done by VT on behalf of Citizen name / Ex. 6

Regarding the EPA/VT connection...Dr. Edwards has conducted extensive research on lead in drinking water, corrosion and corrosion control. He and I and Mike Schock discuss lead in drinking water, corrosion and corrosion control issues from time to time to evaluate the latest published research relevant to EPA's work on the upcoming LCR revisions. Dr. Edwards is an internationally recognized expert in the area of corrosion and corrosion controland served as a technical resource for the NDWAC LCR WG. With Citizen name / Ex. 6 permission, Dr. Edwards has shared the data/information from his work with Citizen name / Ex. 6 with EPA R5.

Hope that helps clarify things.

Subject: FW: One more water question

Miguel, First, please don't shoot the messenger. Can you provide me with a response to Tim's questions below? I told Tim that I did not believe we developed a QAPP for Flint sampling, but needed you to confirm that. I'm also not sure if you personally took the samples or not and if that makes a difference for when a QAPP is needed, but his position is that if EPA is using data that we collected for a written report that we need a QAPP. Questions are also being raised about the role of and relationship we have with VA Tech and why were they analyzing drinking water samples and pipe segments. Any information you can provide to answer those questions would be greatly appreciated.

Corrosive Impact: Leaded Water and One Flint Family's Toxic Nightmare

Jul 09 Posted by Curt Guyette in Democracy Watch

It took a while for LeeAnne Walters to realize the full impact of the number: 13,200.

Walters—a stay-at home mom with four sons and a husband in the Navy—had seen other numbers reflecting the quality of drinking water at her Flint home that were devastating. But 13,200? She'd never seen anything like this.

The city had tested her water twice in this past March and both times found dangerously high levels of lead—104 parts per billion (ppb) and 397 ppb, respectively.

Those numbers filled her with dread, because they meant her family had been exposed to high levels of a terribly toxic heavy metal that put her children's future in jeopardy.

But it was the result of a third test of the tap water in her home, performed by independent experts at Virginia Tech university, that most stunned Walters.

"It took a while for me to wrap my head around it," said Walters.

The VT researchers discovered lead levels in Walters' water reached a jaw-dropping 13,200 ppb—more than twice the amount at which the U.S. Environmental Protection Agency classifies water as hazardous waste.

"When I saw those numbers I was shocked," said Virginia Tech professor Marc Edwards, a former MacArthur Fellow and respected authority on corrosion in drinking-water systems, who oversaw the tests.

Edwards played a key role in discovering the problem of corroded water pipes and lead in Washington, D.C. drinking water during the early 2000s, in what has been described as one of the worst contamination events ever seen in an urban water system, with resulting increased incidence of childhood lead poisoning, miscarriages and fetal death.

In terms of lead levels, the Walters family's numbers eclipsed even the worst D.C. homes.

"I have never in my 25-year career seen such outrageously high levels going into another home in the United States," said Edwards. "This was literally hazardous-waste levels."

But the condition of Walters' tap water raises a much more far-reaching question: Since the city moved away from Detroit's water system and began pumping water from the Flint River, how many other families have been put at risk by the city's questionable testing procedures and handling of the water supply?

The Walters family surely isn't alone in dealing with the threat of lead-laced drinking water. About half of Flint's 40,000 homes are a half-century old or older, built at a time when water service lines were typically made of lead.

And according to various experts, including an EPA water-quality specialist, the city's actions are only exacerbating the threat.

"What the public needs is accurate information," explained Miguel Del Toral, regulations manager for the Ground Water and Drinking Water Branch of the EPA's Region 5.

Instead, the city is utilizing testing measures that almost ensure that worst-case scenarios such as the one facing the Walters family escape detection, asserted Del Toral in an internal EPA memo provided to the ACLU of Michigan.

Compounding the threat is what Del Toral describes as the continued inability of officials to adequately treat water coming into people's homes from the Flint River.

"I don't want to scare people unnecessarily," said Del Toral in a phone interview from his home in Chicago. "But there is absolutely a problem in Flint that needs to be addressed right away."

During his interview with the ACLU of Michigan, Del Toral said he was willing to go on the record with his concerns, but that he was doing so as a private citizen, not as a representative of the EPA.

EPA rules, he said, required that such interviews be routed through the agency's public affairs people. But he's willing to speak out nonetheless, he said, because of the potential harm to the public is so great, and the need to address it is so urgent.

WATERING DOWN THE TESTS

Perhaps the most vexing problem in all of this is the contamination caused by the city's decades-old network of lead and iron pipes—a problem directly connected to the switch to river water, and the city's failure to adequately treat it.

Under the U.S. Environmental Protection Agency's rules, if lead reaches a level of 15 parts per billion in water, the source of the problem must be identified and corrected.

In early March, after months of requests (and only after Walters had received a doctor's note raising concerns about problems with the water), the city finally conducted a test. It found lead levels of 104 ppb the first time. A second test recorded a level of 397 ppb.

Blood tests, taken after those water-sample numbers were reported, revealed that one of her children, a four year old, had lead poisoning.

The news was devastating, said Walters, and the concern it creates for her child's future is haunting.

"Lead can affect almost every organ and system in your body," according to the EPA's web site. "Children six years old and younger are most susceptible … Even low levels of lead in the blood of children can result in: behavior and learning problems; lower IQ and hyperactivity; slowed growth; and hearing problems."

Those dangers made Walters all the more determined to get her questions answered.

For one thing, she wanted to know why residents were being instructed to "pre-flush" water lines before drawing samples that would be tested by the city

After much searching, she found Del Toral at the EPA's Region 5 in Chicago. He explained to her that her instincts were right, and that she had good cause to be concerned about the way testing was being done.

"The practice of pre-flushing before collecting compliance samples has been shown to result in the minimization of lead capture and significant underestimation of lead levels in drinking water," wrote Del Toral in an internal memo dated June 24.

Del Toral went on to say that the city's testing methods were a "serious concern" because they "could provide a false sense of security to the residents of Flint regarding lead levels in the water." As a result, he warned, residents could fail to take the necessary precautions to protect their families from lead in the drinking water.

Virginia Tech's Edwards completely agrees with Del Toral's assessment.

"The net effect of a 'pre-flush' is to greatly reduce the likelihood of detecting lead in samples collected … that would normally be present in the consumers drinking water," Edwards wrote in an email. "I have long maintained that the practice should be banned, as it artificially lowers the amount of lead detected in samples versus typical consumer exposure."

Asked about these concerns, city spokesman Jason Lorenz offered the following email reply: "While I cannot directly respond to Mr. Del Toral's remarks without first contacting the EPA Region 5 office, I can say that the City of Flint follows all the testing procedures and schedules as required by the U.S. EPA."

He added that the Michigan Department of Environmental Quality (MDEQ) endorses the city's sampling method. The MDEQ did not respond to phone calls and e-mails seeking its comments on the controversy.

Del Toral contended in an interview that what Flint's doing is actually exploiting a "loophole" in the law.

"From a technical standpoint, there's no justification for the way Flint is conducting its tests," Del Toral said. "Any credible scientist will tell you [the city's] method is not the way to catch worst-case conditions."

There is no legitimate reason for the city's methodology, said Del Toral.

EPA rules, he said, required that such interviews be routed through the agency's public affairs people. But he was willing to speak out nonetheless, he said, because of the potential harm to the public.

FLUSHING OUT REAL ANSWERS

It was Del Toral who, after determining that the lead problem plaguing the Walters family was coming from outside their home, connected LeeAnne with Edwards at Virginia Tech.

Instead of taking a single sample after a line had been "pre-flushed" under the city's direction, Edwards instructed Walters to collect a series of samples from water that had been allowed to sit in the service line long enough to accurately reflect levels the family could be exposed to under normal use.

(Meanwhile, that same service line, dug up and replaced after the sample collection, was found to be made of lead in one section and iron in another.)

Edwards tested the water and discovered that the lead contamination ranged from 200 ppb to the 13,200 ppb figure that stunned LeeAnne Walters—and should likewise shock many others.

Given the age of much of Flint's infrastructure, Edwards agrees with Del Toral's assessment that the test results they found at the Walters home amount to an alarm going off, and others in the city need to pay attention.

"I do not see any reason why there would not be serious problems occurring in at least some other Flint homes," said Edwards.

In 1986, the U.S. Safe Drinking Water Act was amended to prohibit the use of lead pipes in public water systems. Every house built before that is potentially at risk, said Edwards. About half of Flint's roughly 40,000 homes are at least 50 years old.

Making things worse is the fact that the high levels of chlorine being used to treat Flint's dirty river water lead to the creation of a carcinogenic byproduct know as total trihalomethanes, or TTHM. To keep TTHM levels down, the city is adding ferric chloride. The trouble is, that additive can also accelerate the corrosion of lead and iron pipes.

Adding yet another layer to the problem is something the city is not doing.

According to Del Toral, Flint should be adding corrosion-control chemicals designed to help keep lead and copper in pipes from leaching into drinking water. Doing so is required by federal regulations, wrote Del Toral in his memo.

"To our knowledge, that is inaccurate," said Flint spokesman Lorenz. "Before the plant was placed in operation, the City (and our engineering firm) had numerous discussions with DEQ personnel and inquired if corrosion-control chemicals – typically phosphates --needed to be included in the treatment process. The use of these chemicals was not required or mandated."

What's indisputable is this:

Flint's water contained corrosion-control chemicals until April 2014, when Flint's ties to the Detroit water system were severed. Flint officials hailed that changeover as a cost-cutting move for a city facing a financial crisis so severe it had been placed under the control of a state-appointed emergency manager.

Discontinuing the use of the anti-corrosion chemicals allowed toxic scale built up on the insides of pipes over the past decades to be released into water flowing into people's homes, explained Del Toral.

In his memo, Del Toral warned: "The lack of mitigating treatment is especially concerning as the high lead levels [that result] will likely not be reflected in the City of Flint's compliance samples due to sampling procedures used…"

In other words, at the same time the city is exacerbating the problem, it's conducting tests that will probably fail to identify the true extent of the threat.

Del Toral described the situation as a “major concern.”

“In the absence of any corrosion control treatment, lead levels in drinking water can be expected to increase,” he warned in his memo.

The EPA offered Flint officials the use of agency experts to help get the situation under control, said Del Toral, but added that, to his knowledge, the city has so far declined all help.

LeeAnne Walters said that when she asked why city officials weren’t taking the EPA’s offer of assistance, she was told, “We don’t need it.”

Flint spokesman Lorenz, on the other hand, maintained that “the city continues to work closely with the MDEQ and the EPA Regional Office.”

As for Walters’s family, that the city has finally replaced the service line leading to their home, and lead levels have dropped below the 15 ppb EPA action level.

The problem now, she said, is that water currently coming out of her tap tinged yellow and smells of rotten eggs. City officials have given her no explanation as to the possible cause of that.

It is just one more in a long list of questions that need to be addressed.

“What we need,” said Walters, “are more answers.”

But it’s not just answers the people of Flint require.

They also need solutions. And, as Del Toral's EPA memo emphasizes, they need them immediately.

Corrosive Impact: Leaded Water and One Flint Family's Toxic Nightmare

Jul 09 Posted by Curt Guyette in Democracy Watch

It took a while for LeeAnne Walters to realize the full impact of the number: 13,200.

Walters—a stay-at home mom with four sons and a husband in the Navy—had seen other numbers reflecting the quality of drinking water at her Flint home that were devastating. But 13,200? She'd never seen anything like this.

The city had tested her water twice in this past March and both times found dangerously high levels of lead—104 parts per billion (ppb) and 397 ppb, respectively.

Those numbers filled her with dread, because they meant her family had been exposed to high levels of a terribly toxic heavy metal that put her children's future in jeopardy.

But it was the result of a third test of the tap water in her home, performed by independent experts at Virginia Tech university, that most stunned Walters.

"It took a while for me to wrap my head around it," said Walters.

The VT researchers discovered lead levels in Walters' water reached a jaw-dropping 13,200 ppb—more than twice the amount at which the U.S. Environmental Protection Agency classifies water as hazardous waste.

“When I saw those numbers I was shocked,” said Virginia Tech professor Marc Edwards, a former MacArthur Fellow and respected authority on corrosion in drinking-water systems, who oversaw the tests.

Edwards played a key role in discovering the problem of corroded water pipes and lead in Washington, D.C. drinking water during the early 2000s, in what has been described as one of the worst contamination events ever seen in an urban water system, with resulting increased incidence of childhood lead poisoning, miscarriages and fetal death.

In terms of lead levels, the Walters family’s numbers eclipsed even the worst D.C. homes.

“I have never in my 25-year career seen such outrageously high levels going into another home in the United States,” said Edwards. “This was literally hazardous-waste levels.”

But the condition of Walters’ tap water raises a much more far-reaching question: Since the city moved away from Detroit’s water system and began pumping water from the Flint River, how many other families have been put at risk by the city’s questionable testing procedures and handling of the water supply?

The Walters family surely isn’t alone in dealing with the threat of lead-laced drinking water. About half of Flint’s 40,000 homes are a half-century old or older, built at a time when water service lines were typically made of lead.

And according to various experts, including an EPA water-quality specialist, the city’s actions are only exacerbating the threat.

“What the public needs is accurate information,” explained Miguel Del Toral, regulations manager for the Ground Water and Drinking Water Branch of the EPA’s Region 5.

Instead, the city is utilizing testing measures that almost ensure that worst-case scenarios such as the one facing the Walters family escape detection, asserted Del Toral in an internal EPA memo provided to the ACLU of Michigan.

Compounding the threat is what Del Toral describes as the continued inability of officials to adequately treat water coming into people's homes from the Flint River.

"I don't want to scare people unnecessarily," said Del Toral in a phone interview from his home in Chicago. "But there is absolutely a problem in Flint that needs to be addressed right away."

During his interview with the ACLU of Michigan, Del Toral said he was willing to go on the record with his concerns, but that he was doing so as a private citizen, not as a representative of the EPA.

EPA rules, he said, required that such interviews be routed through the agency's public affairs people. But he's willing to speak out nonetheless, he said, because of the potential harm to the public is so great, and the need to address it is so urgent.

WATERING DOWN THE TESTS

Perhaps the most vexing problem in all of this is the contamination caused by the city's decades-old network of lead and iron pipes—a problem directly connected to the switch to river water, and the city's failure to adequately treat it.

Under the U.S. Environmental Protection Agency's rules, if lead reaches a level of 15 parts per billion in water, the source of the problem must be identified and corrected.

In early March, after months of requests (and only after Walters had received a doctor's note raising concerns about problems with the water), the city finally conducted a test. It found lead levels of 104 ppb the first time. A second test recorded a level of 397 ppb.

Blood tests, taken after those water-sample numbers were reported, revealed that one of her children, a four year old, had lead poisoning.

The news was devastating, said Walters, and the concern it creates for her child's future is haunting.

"Lead can affect almost every organ and system in your body," according to the EPA's web site. "Children six years old and younger are most susceptible … Even low levels of lead in the blood of children can result in: behavior and learning problems; lower IQ and hyperactivity; slowed growth; and hearing problems."

Those dangers made Walters all the more determined to get her questions answered.

For one thing, she wanted to know why residents were being instructed to "pre-flush" water lines before drawing samples that would be tested by the city

After much searching, she found Del Toral at the EPA's Region 5 in Chicago. He explained to her that her instincts were right, and that she had good cause to be concerned about the way testing was being done.

"The practice of pre-flushing before collecting compliance samples has been shown to result in the minimization of lead capture and significant underestimation of lead levels in drinking water," wrote Del Toral in an internal memo dated June 24.

Del Toral went on to say that the city's testing methods were a "serious concern" because they "could provide a false sense of security to the residents of Flint regarding lead levels in the water." As a result, he warned, residents could fail to take the necessary precautions to protect their families from lead in the drinking water.

Virginia Tech's Edwards completely agrees with Del Toral's assessment.

“The net effect of a ‘pre-flush’ is to greatly reduce the likelihood of detecting lead in samples collected … that would normally be present in the consumers drinking water,” Edwards wrote in an email. “I have long maintained that the practice should be banned, as it artificially lowers the amount of lead detected in samples versus typical consumer exposure.”

Asked about these concerns, city spokesman Jason Lorenz offered the following email reply: “While I cannot directly respond to Mr. Del Toral's remarks without first contacting the EPA Region 5 office, I can say that the City of Flint follows all the testing procedures and schedules as required by the U.S. EPA.”

He added that the Michigan Department of Environmental Quality (MDEQ) endorses the city’s sampling method. The MDEQ did not respond to phone calls and e-mails seeking its comments on the controversy.

Del Toral contended in an interview that what Flint’s doing is actually exploiting a “loophole” in the law.

“From a technical standpoint, there’s no justification for the way Flint is conducting its tests,” Del Toral said. “Any credible scientist will tell you [the city’s] method is not the way to catch worst-case conditions.”

There is no legitimate reason for the city’s methodology, said Del Toral.

EPA rules, he said, required that such interviews be routed through the agency’s public affairs people. But he was willing to speak out nonetheless, he said, because of the potential harm to the public.

FLUSHING OUT REAL ANSWERS

It was Del Toral who, after determining that the lead problem plaguing the Walters family was coming from outside their home, connected LeeAnne with Edwards at Virginia Tech.

Instead of taking a single sample after a line had been "pre-flushed" under the city's direction, Edwards instructed Walters to collect a series of samples from water that had been allowed to sit in the service line long enough to accurately reflect levels the family could be exposed to under normal use.

(Meanwhile, that same service line, dug up and replaced after the sample collection, was found to be made of lead in one section and iron in another.)

Edwards tested the water and discovered that the lead contamination ranged from 200 ppb to the 13,200 ppb figure that stunned LeeAnne Walters—and should likewise shock many others.

Given the age of much of Flint's infrastructure, Edwards agrees with Del Toral's assessment that the test results they found at the Walters home amount to an alarm going off, and others in the city need to pay attention.

"I do not see any reason why there would not be serious problems occurring in at least some other Flint homes," said Edwards.

In 1986, the U.S. Safe Drinking Water Act was amended to prohibit the use of lead pipes in public water systems. Every house built before that is potentially at risk, said Edwards. About half of Flint's roughly 40,000 homes are at least 50 years old.

Making things worse is the fact that the high levels of chlorine being used to treat Flint's dirty river water lead to the creation of a carcinogenic byproduct know as total trihalomethanes, or TTHM. To keep TTHM levels down, the city is adding ferric chloride. The trouble is, that additive can also accelerate the corrosion of lead and iron pipes.

Adding yet another layer to the problem is something the city is not doing.

According to Del Toral, Flint should be adding corrosion-control chemicals designed to help keep lead and copper in pipes from leaching into drinking water. Doing so is required by federal regulations, wrote Del Toral in his memo.

"To our knowledge, that is inaccurate," said Flint spokesman Lorenz. "Before the plant was placed in operation, the City (and our engineering firm) had numerous discussions with DEQ personnel and inquired if corrosion-control chemicals – typically phosphates --needed to be included in the treatment process. The use of these chemicals was not required or mandated."

What's indisputable is this:

Flint's water contained corrosion-control chemicals until April 2014, when Flint's ties to the Detroit water system were severed. Flint officials hailed that changeover as a cost-cutting move for a city facing a financial crisis so severe it had been placed under the control of a state-appointed emergency manager.

Discontinuing the use of the anti-corrosion chemicals allowed toxic scale built up on the insides of pipes over the past decades to be released into water flowing into people's homes, explained Del Toral.

In his memo, Del Toral warned: "The lack of mitigating treatment is especially concerning as the high lead levels [that result] will likely not be reflected in the City of Flint's compliance samples due to sampling procedures used…"

In other words, at the same time the city is exacerbating the problem, it's conducting tests that will probably fail to identify the true extent of the threat.

Del Toral described the situation as a "major concern."

“In the absence of any corrosion control treatment, lead levels in drinking water can be expected to increase,” he warned in his memo.

The EPA offered Flint officials the use of agency experts to help get the situation under control, said Del Toral, but added that, to his knowledge, the city has so far declined all help.

LeeAnne Walters said that when she asked why city officials weren’t taking the EPA’s offer of assistance, she was told, “We don’t need it.”

Flint spokesman Lorenz, on the other hand, maintained that “the city continues to work closely with the MDEQ and the EPA Regional Office.”

As for Walters’s family, that the city has finally replaced the service line leading to their home, and lead levels have dropped below the 15 ppb EPA action level.

The problem now, she said, is that water currently coming out of her tap tinged yellow and smells of rotten eggs. City officials have given her no explanation as to the possible cause of that.

It is just one more in a long list of questions that need to be addressed.

“What we need,” said Walters, “are more answers.”

But it’s not just answers the people of Flint require.

They also need solutions. And, as Del Toral’s EPA memo emphasizes, they need them immediately.

FOR IMMEDIATE RELEASE:

July 9, 2015

CONTACT: Darrell Dawsey, ACLU of Michigan, 313-578-6831; ddawsey@aclumich.org

DETROIT—Describing the toxicity of one Flint household's tap water as "hazardous-waste levels," alarmed water-quality experts warned in a new ACLU of Michigan report that Flint officials are using a "loophole" in water testing guidelines that skews test results, exacerbates water woes in the city and could create a "false sense of security" about the Flint water supply.

"It is both outrageous and heartbreaking to think that families with small children have been allowed to drink, bathe and cook with water so thoroughly polluted by lead," said ACLU of Michigan executive director Kary Moss. "It's even worse to have to worry that city officials may not only be avoiding the truth about the lead levels, but may be making the problem worse. The people of Flint deserve to know whether their water is hazardous."

Interviewed as part of "Corrosive Impact," an explosive new ACLU report that focuses on one Flint family's ordeal with lead-contaminated water, university researcher Marc Edwards and EPA manager Miguel Del Toral both expressed grave concern about the city's water supply and testing measures after Edwards' independent analysis of the family's tap water revealed lead levels that were more than five times higher than what city tests showed. The report, focused on the Walters family in Flint, was compiled by ACLU of Michigan investigative reporter Curt Guyette.

"I have never in my 25-year career seen such outrageously high levels going into another home in the United States," said Edwards. "This was literally hazardous-waste levels."

Flint has come under increasing scrutiny for its poor water quality ever since an emergency manager severed the city's ties to the Detroit water system in 2014 and ordered the city to begin pumping its water from the Flint River.

The report draws heavily from an internal U.S. Environmental Protection Agency memo that asserts that the city is exacerbating the public health threat of lead-laced water while at the same time conducting tests that minimize the dangers posed to other residents throughout the city. Of greatest concern is the city's practice of having residents "pre-flush" their home plumbing systems before city officials test the water.

"The practice of pre-flushing before collecting compliance samples has been shown to result in the minimization of lead capture and significant underestimation of lead levels in the drinking water," the memo states.

The memo also says the city discontinued corrosion control treatments for lead and copper, materials found in many of the pipes in the city's aging water and sewerage infrastructure: "A major concern from a public health standpoint is the absence of corrosion control treatment in the City of Flint for mitigating lead and copper levels in the drinking water."

Del Toral, who was interviewed for the article as a private citizen, not as an EPA official, underscored the need for the city officials to respond the problem immediately.

“I don’t want to scare people unnecessarily,” said Del Toral. “But there is absolutely a problem in Flint that needs to be addressed right away.”

DETROIT—Describing the toxicity of one Flint household's tap water as "hazardous-waste levels," alarmed water-quality experts warned in a new ACLU of Michigan report that Flint officials are using a "loophole" in water testing guidelines that skews test results, exacerbates water woes in the city and could create a "false sense of security" about the Flint water supply.

“It is both outrageous and heartbreaking to think that families with small children have been allowed to drink, bathe and cook with water so thoroughly polluted by lead,” said ACLU of Michigan executive director Kary Moss. “It’s even worse to have to worry that city officials may not only be avoiding the truth about the lead levels, but may be making the problem worse. The people of Flint deserve to know whether their water is hazardous.”

Interviewed as part of “Corrosive Impact,” an explosive new ACLU report that focuses on one Flint family’s ordeal with lead-contaminated water, university researcher Marc Edwards and EPA manager Miguel Del Toral both expressed grave concern about the city’s water supply and testing measures after Edwards’ independent analysis of the family’s tap water revealed lead levels that were more than five times higher than what city tests showed. The report, focused on the Walters family in Flint, was compiled by ACLU of Michigan investigative reporter Curt Guyette.

“I have never in my 25-year career seen such outrageously high levels going into another home in the United States,” said Edwards. “This was literally hazardous-waste levels.”

Flint has come under increasing scrutiny for its poor water quality ever since an emergency manager severed the city’s ties to the Detroit water system in 2014 and ordered the city to begin pumping its water from the Flint River.

The report draws heavily from an internal U.S. Environmental Protection Agency memo that asserts that the city is exacerbating the public health threat of lead-laced water while at the same time conducting tests that minimize the dangers posed to other residents throughout the city. Of greatest concern is the city’s practice of having residents “pre-flush” their home plumbing systems before city officials test the water.

“The practice of pre-flushing before collecting compliance samples has been shown to result in the minimization of lead capture and significant underestimation of lead levels in the drinking water,” the memo states.

The memo also says the city discontinued corrosion control treatments for lead and copper, materials found in many of the pipes in the city’s aging water and sewerage infrastructure: “A major concern from a public health standpoint is the absence of corrosion control treatment in the City of Flint for mitigating lead and copper levels in the drinking water.”

Corrosive Impact: Leaded Water and One Flint Family's Toxic Nightmare

Jul 09 Posted by Curt Guyette in Democracy Watch

It took a while for LeeAnne Walters to realize the full impact of the number: 13,200.

Walters—a stay-at home mom with four sons and a husband in the Navy—had seen other numbers reflecting the quality of drinking water at her Flint home that were devastating. But 13,200? She'd never seen anything like this.

The city had tested her water twice in this past March and both times found dangerously high levels of lead—104 parts per billion (ppb) and 397 ppb, respectively.

Those numbers filled her with dread, because they meant her family had been exposed to high levels of a terribly toxic heavy metal that put her children's future in jeopardy.

But it was the result of a third test of the tap water in her home, performed by independent experts at Virginia Tech university, that most stunned Walters.

"It took a while for me to wrap my head around it," said Walters.

The VT researchers discovered lead levels in Walters' water reached a jaw-dropping 13,200 ppb—more than twice the amount at which the U.S. Environmental Protection Agency classifies water as hazardous waste.

“When I saw those numbers I was shocked,” said Virginia Tech professor Marc Edwards, a former MacArthur Fellow and respected authority on corrosion in drinking-water systems, who oversaw the tests.

Edwards played a key role in discovering the problem of corroded water pipes and lead in Washington, D.C. drinking water during the early 2000s, in what has been described as one of the worst contamination events ever seen in an urban water system, with resulting increased incidence of childhood lead poisoning, miscarriages and fetal death.

In terms of lead levels, the Walters family’s numbers eclipsed even the worst D.C. homes.

“I have never in my 25-year career seen such outrageously high levels going into another home in the United States,” said Edwards. “This was literally hazardous-waste levels.”

But the condition of Walters’ tap water raises a much more far-reaching question: Since the city moved away from Detroit’s water system and began pumping water from the Flint River, how many other families have been put at risk by the city’s questionable testing procedures and handling of the water supply?

The Walters family surely isn’t alone in dealing with the threat of lead-laced drinking water. About half of Flint’s 40,000 homes are a half-century old or older, built at a time when water service lines were typically made of lead.

And according to various experts, including an EPA water-quality specialist, the city’s actions are only exacerbating the threat.

“What the public needs is accurate information,” explained Miguel Del Toral, regulations manager for the Ground Water and Drinking Water Branch of the EPA’s Region 5.

Instead, the city is utilizing testing measures that almost ensure that worst-case scenarios such as the one facing the Walters family escape detection, asserted Del Toral in an internal EPA memo provided to the ACLU of Michigan.

Compounding the threat is what Del Toral describes as the continued inability of officials to adequately treat water coming into people's homes from the Flint River.

"I don't want to scare people unnecessarily," said Del Toral in a phone interview from his home in Chicago. "But there is absolutely a problem in Flint that needs to be addressed right away."

During his interview with the ACLU of Michigan, Del Toral said he was willing to go on the record with his concerns, but that he was doing so as a private citizen, not as a representative of the EPA.

EPA rules, he said, required that such interviews be routed through the agency's public affairs people. But he's willing to speak out nonetheless, he said, because of the potential harm to the public is so great, and the need to address it is so urgent.

WATERING DOWN THE TESTS

Perhaps the most vexing problem in all of this is the contamination caused by the city's decades-old network of lead and iron pipes—a problem directly connected to the switch to river water, and the city's failure to adequately treat it.

Under the U.S. Environmental Protection Agency's rules, if lead reaches a level of 15 parts per billion in water, the source of the problem must be identified and corrected.

In early March, after months of requests (and only after Walters had received a doctor's note raising concerns about problems with the water), the city finally conducted a test. It found lead levels of 104 ppb the first time. A second test recorded a level of 397 ppb.

Blood tests, taken after those water-sample numbers were reported, revealed that one of her children, a four year old, had lead poisoning.

The news was devastating, said Walters, and the concern it creates for her child's future is haunting.

"Lead can affect almost every organ and system in your body," according to the EPA's web site. "Children six years old and younger are most susceptible … Even low levels of lead in the blood of children can result in: behavior and learning problems; lower IQ and hyperactivity; slowed growth; and hearing problems."

Those dangers made Walters all the more determined to get her questions answered.

For one thing, she wanted to know why residents were being instructed to "pre-flush" water lines before drawing samples that would be tested by the city

After much searching, she found Del Toral at the EPA's Region 5 in Chicago. He explained to her that her instincts were right, and that she had good cause to be concerned about the way testing was being done.

"The practice of pre-flushing before collecting compliance samples has been shown to result in the minimization of lead capture and significant underestimation of lead levels in drinking water," wrote Del Toral in an internal memo dated June 24.

Del Toral went on to say that the city's testing methods were a "serious concern" because they "could provide a false sense of security to the residents of Flint regarding lead levels in the water." As a result, he warned, residents could fail to take the necessary precautions to protect their families from lead in the drinking water.

Virginia Tech's Edwards completely agrees with Del Toral's assessment.

"The net effect of a 'pre-flush' is to greatly reduce the likelihood of detecting lead in samples collected … that would normally be present in the consumers drinking water," Edwards wrote in an email. "I have long maintained that the practice should be banned, as it artificially lowers the amount of lead detected in samples versus typical consumer exposure."

Asked about these concerns, city spokesman Jason Lorenz offered the following email reply: "While I cannot directly respond to Mr. Del Toral's remarks without first contacting the EPA Region 5 office, I can say that the City of Flint follows all the testing procedures and schedules as required by the U.S. EPA."

He added that the Michigan Department of Environmental Quality (MDEQ) endorses the city's sampling method. The MDEQ did not respond to phone calls and e-mails seeking its comments on the controversy.

Del Toral contended in an interview that what Flint's doing is actually exploiting a "loophole" in the law.

"From a technical standpoint, there's no justification for the way Flint is conducting its tests," Del Toral said. "Any credible scientist will tell you [the city's] method is not the way to catch worst-case conditions."

There is no legitimate reason for the city's methodology, said Del Toral.

EPA rules, he said, required that such interviews be routed through the agency's public affairs people. But he was willing to speak out nonetheless, he said, because of the potential harm to the public.

FLUSHING OUT REAL ANSWERS

It was Del Toral who, after determining that the lead problem plaguing the Walters family was coming from outside their home, connected LeeAnne with Edwards at Virginia Tech.

Instead of taking a single sample after a line had been “pre-flushed” under the city’s direction, Edwards instructed Walters to collect a series of samples from water that had been allowed to sit in the service line long enough to accurately reflect levels the family could be exposed to under normal use.

(Meanwhile, that same service line, dug up and replaced after the sample collection, was found to be made of lead in one section and iron in another.)

Edwards tested the water and discovered that the lead contamination ranged from 200 ppb to the 13,200 ppb figure that stunned LeeAnne Walters—and should likewise shock many others.

Given the age of much of Flint’s infrastructure, Edwards agrees with Del Toral’s assessment that the test results they found at the Walters home amount to an alarm going off, and others in the city need to pay attention.

“I do not see any reason why there would not be serious problems occurring in at least some other Flint homes,” said Edwards.

In 1986, the U.S. Safe Drinking Water Act was amended to prohibit the use of lead pipes in public water systems. Every house built before that is potentially at risk, said Edwards. About half of Flint’s roughly 40,000 homes are at least 50 years old.

Making things worse is the fact that the high levels of chlorine being used to treat Flint’s dirty river water lead to the creation of a carcinogenic byproduct know as total trihalomethanes, or TTHM. To keep TTHM levels down, the city is adding ferric chloride. The trouble is, that additive can also accelerate the corrosion of lead and iron pipes.

Adding yet another layer to the problem is something the city is not doing.

According to Del Toral, Flint should be adding corrosion-control chemicals designed to help keep lead and copper in pipes from leaching into drinking water. Doing so is required by federal regulations, wrote Del Toral in his memo.

“To our knowledge, that is inaccurate,” said Flint spokesman Lorenz. “Before the plant was placed in operation, the City (and our engineering firm) had numerous discussions with DEQ personnel and inquired if corrosion-control chemicals – typically phosphates --needed to be included in the treatment process. The use of these chemicals was not required or mandated.”

What’s indisputable is this:

Flint’s water contained corrosion-control chemicals until April 2014, when Flint’s ties to the Detroit water system were severed. Flint officials hailed that changeover as a cost-cutting move for a city facing a financial crisis so severe it had been placed under the control of a state-appointed emergency manager.

Discontinuing the use of the anti-corrosion chemicals allowed toxic scale built up on the insides of pipes over the past decades to be released into water flowing into people’s homes, explained Del Toral.

In his memo, Del Toral warned: “The lack of mitigating treatment is especially concerning as the high lead levels [that result] will likely not be reflected in the City of Flint’s compliance samples due to sampling procedures used…”

In other words, at the same time the city is exacerbating the problem, it’s conducting tests that will probably fail to identify the true extent of the threat.

Del Toral described the situation as a “major concern.”

“In the absence of any corrosion control treatment, lead levels in drinking water can be expected to increase,” he warned in his memo.

The EPA offered Flint officials the use of agency experts to help get the situation under control, said Del Toral, but added that, to his knowledge, the city has so far declined all help.

LeeAnne Walters said that when she asked why city officials weren’t taking the EPA’s offer of assistance, she was told, “We don’t need it.”

Flint spokesman Lorenz, on the other hand, maintained that “the city continues to work closely with the MDEQ and the EPA Regional Office.”

As for Walters’s family, that the city has finally replaced the service line leading to their home, and lead levels have dropped below the 15 ppb EPA action level.

The problem now, she said, is that water currently coming out of her tap tinged yellow and smells of rotten eggs. City officials have given her no explanation as to the possible cause of that.

It is just one more in a long list of questions that need to be addressed.

“What we need,” said Walters, “are more answers.”

But it’s not just answers the people of Flint require.

They also need solutions. And, as Del Toral’s EPA memo emphasizes, they need them immediately.

>>
>> Walters—a stay-at home mom with four sons and a husband in the Navy—had seen other numbers reflecting the quality of drinking water at her Flint home that were devastating. But 13,200? She'd never seen anything like this.
>>
>> The city had tested her water twice in this past March and both times found dangerously high levels of lead—104 parts per billion (ppb) and 397 ppb, respectively.

Those numbers filled her with dread, because they meant her family had been exposed to high levels of a terribly toxic heavy metal that put her children's future in jeopardy.

But it was the result of a third test of the tap water in her home, performed by independent experts at Virginia Tech university, that most stunned Walters.

"It took a while for me to wrap my head around it," said Walters.

The VT researchers discovered lead levels in Walters' water reached a jaw-dropping 13,200 ppb—more than twice the amount at which the U.S. Environmental Protection Agency classifies water as hazardous waste.

"When I saw those numbers I was shocked," said Virginia Tech professor Marc Edwards, a former MacArthur Fellow and respected authority on corrosion in drinking-water systems, who oversaw the tests.

Edwards played a key role in discovering the problem of corroded water pipes and lead in Washington, D.C. drinking water during the early 2000s, in what has been described as one of the worst contamination events ever seen in an urban water system, with resulting increased incidence of childhood lead poisoning, miscarriages and fetal death.

In terms of lead levels, the Walters family's numbers eclipsed even the worst D.C. homes.

"I have never in my 25-year career seen such outrageously high levels going into another home in the United States," said Edwards. "This was literally hazardous-waste levels."

But the condition of Walters' tap water raises a much more far-reaching question: Since the city moved away from Detroit's water system and began pumping water from the Flint River, how many other families have been put at risk by the city's questionable testing procedures and handling of the water supply?

The Walters family surely isn't alone in dealing with the threat of lead-laced drinking water. About half of Flint's 40,000 homes are a half-century old or older, built at a time when water service lines were typically made of lead.

And according to various experts, including an EPA water-quality specialist, the city's actions are only exacerbating the threat.

"What the public needs is accurate information," explained Miguel Del Toral, regulations manager for the Ground Water and Drinking Water Branch of the EPA's Region 5.

Instead, the city is utilizing testing measures that almost ensure that worst-case scenarios such as the one facing the Walters family escape detection, asserted Del Toral in an internal EPA memo provided to the ACLU of Michigan.

Compounding the threat is what Del Toral describes as the continued inability of officials to adequately treat water coming into people's homes from the Flint River.

"I don't want to scare people unnecessarily," said Del Toral in a phone interview from his home in Chicago. "But there is absolutely a problem in Flint that needs to be addressed right away."

During his interview with the ACLU of Michigan, Del Toral said he was willing to go on the record with his concerns, but that he was doing so as a private citizen, not as a representative of the EPA.

EPA rules, he said, required that such interviews be routed through the agency's public affairs people. But he's willing to speak out nonetheless, he said, because of the potential harm to the public is so great, and the need to address it is so urgent.

WATERING DOWN THE TESTS

Perhaps the most vexing problem in all of this is the contamination caused by the city's decades-old network of lead and iron pipes—a problem directly connected to the switch to river water, and the city's failure to adequately treat it.

Under the U.S. Environmental Protection Agency's rules, if lead reaches a level of 15 parts per billion in water, the source of the problem must be identified and corrected.

In early March, after months of requests (and only after Walters had received a doctor's note raising concerns about problems with the water), the city finally conducted a test. It found lead levels of 104 ppb the first time. A second test recorded a level of 397 ppb.

Blood tests, taken after those water-sample numbers were reported, revealed that one of her children, a four year old, had lead poisoning.

The news was devastating, said Walters, and the concern it creates for her child's future is haunting.

"Lead can affect almost every organ and system in your body," according to the EPA's web site. "Children six years old and younger are most susceptible … Even low levels of lead in the blood of children can result in: behavior and learning problems; lower IQ and hyperactivity; slowed growth; and hearing problems."

Those dangers made Walters all the more determined to get her questions answered.

For one thing, she wanted to know why residents were being instructed to "pre-flush" water lines before drawing samples that would be tested by the city

After much searching, she found Del Toral at the EPA's Region 5 in Chicago. He explained to her that her instincts were right, and that she had good cause to be concerned about the way testing was being done.

"The practice of pre-flushing before collecting compliance samples has been shown to result in the minimization of lead capture and significant underestimation of lead levels in drinking water," wrote Del Toral in an internal memo dated June 24.

Del Toral went on to say that the city's testing methods were a "serious concern" because they "could provide a false sense of security to the residents of Flint regarding lead levels in the water." As a result, he warned, residents could fail to take the necessary precautions to protect their families from lead in the drinking water.

Virginia Tech's Edwards completely agrees with Del Toral's assessment.

"The net effect of a 'pre-flush' is to greatly reduce the likelihood of detecting lead in samples collected … that would normally be present in the consumers drinking water," Edwards wrote in an email. "I have long maintained that the practice should be banned, as it artificially lowers the amount of lead detected in samples versus typical consumer exposure."

Asked about these concerns, city spokesman Jason Lorenz offered the following email reply: "While I cannot directly respond to Mr. Del Toral's remarks without first contacting the EPA Region 5 office, I can say that the City of Flint follows all the testing procedures and schedules as required by the U.S. EPA."

He added that the Michigan Department of Environmental Quality (MDEQ) endorses the city's sampling method. The MDEQ did not respond to phone calls and e-mails seeking its comments on the controversy.

Del Toral contended in an interview that what Flint's doing is actually exploiting a "loophole" in the law.

“From a technical standpoint, there’s no justification for the way Flint is conducting its tests,” Del Toral said. “Any credible scientist will tell you [the city’s] method is not the way to catch worst-case conditions.”

There is no legitimate reason for the city’s methodology, said Del Toral.

EPA rules, he said, required that such interviews be routed through the agency’s public affairs people. But he was willing to speak out nonetheless, he said, because of the potential harm to the public.

FLUSHING OUT REAL ANSWERS

It was Del Toral who, after determining that the lead problem plaguing the Walters family was coming from outside their home, connected LeeAnne with Edwards at Virginia Tech.

Instead of taking a single sample after a line had been “pre-flushed” under the city’s direction, Edwards instructed Walters to collect a series of samples from water that had been allowed to sit in the service line long enough to accurately reflect levels the family could be exposed to under normal use.

(Meanwhile, that same service line, dug up and replaced after the sample collection, was found to be made of lead in one section and iron in another.)

Edwards tested the water and discovered that the lead contamination ranged from 200 ppb to the 13,200 ppb figure that stunned LeeAnne Walters—and should likewise shock many others.

Given the age of much of Flint’s infrastructure, Edwards agrees with Del Toral’s assessment that the test results they found at the Walters home amount to an alarm going off, and others in the city need to pay attention.

“I do not see any reason why there would not be serious problems occurring in at least some other Flint homes,” said Edwards.

In 1986, the U.S. Safe Drinking Water Act was amended to prohibit the use of lead pipes in public water systems. Every house built before that is potentially at risk, said Edwards. About half of Flint’s roughly 40,000 homes are at least 50 years old.

Making things worse is the fact that the high levels of chlorine being used to treat Flint’s dirty river water lead to the creation of a carcinogenic byproduct know as total trihalomethanes, or TTHM. To keep TTHM levels down, the city is adding ferric chloride. The trouble is, that additive can also accelerate the corrosion of lead and iron pipes.

Adding yet another layer to the problem is something the city is not doing.

According to Del Toral, Flint should be adding corrosion-control chemicals designed to help keep lead and copper in pipes from leaching into drinking water. Doing so is required by federal regulations, wrote Del Toral in his memo.

“To our knowledge, that is inaccurate,” said Flint spokesman Lorenz. “Before the plant was placed in operation, the City (and our engineering firm) had numerous discussions with DEQ personnel and inquired if corrosion-control chemicals – typically phosphates --needed to be included in the treatment process. The use of these chemicals was not required or mandated.”

What’s indisputable is this:

Flint’s water contained corrosion-control chemicals until April 2014, when Flint’s ties to the Detroit water system were severed. Flint officials hailed that changeover as a cost-cutting move for a city facing a financial crisis so severe it had been placed under the control of a state-appointed emergency manager.

Discontinuing the use of the anti-corrosion chemicals allowed toxic scale built up on the insides of pipes over the past decades to be released into water flowing into people's homes, explained Del Toral.

In his memo, Del Toral warned: "The lack of mitigating treatment is especially concerning as the high lead levels [that result] will likely not be reflected in the City of Flint's compliance samples due to sampling procedures used…"

In other words, at the same time the city is exacerbating the problem, it's conducting tests that will probably fail to identify the true extent of the threat.

Del Toral described the situation as a "major concern."

"In the absence of any corrosion control treatment, lead levels in drinking water can be expected to increase," he warned in his memo.

The EPA offered Flint officials the use of agency experts to help get the situation under control, said Del Toral, but added that, to his knowledge, the city has so far declined all help.

LeeAnne Walters said that when she asked why city officials weren't taking the EPA's offer of assistance, she was told, "We don't need it."

Flint spokesman Lorenz, on the other hand, maintained that "the city continues to work closely with the MDEQ and the EPA Regional Office."

As for Walters's family, that the city has finally replaced the service line leading to their home, and lead levels have dropped below the 15 ppb EPA action level.

The problem now, she said, is that water currently coming out of her tap tinged yellow and smells of rotten eggs. City officials have given her no explanation as to the possible cause of that.

It is just one more in a long list of questions that need to be addressed.

“What we need,” said Walters, “are more answers.”

But it’s not just answers the people of Flint require.

They also need solutions. And, as Del Toral’s EPA memo emphasizes, they need them immediately.

Up to you folks, but just so you know...Flint is likely to have an LCR monitoring violation and may end up with a lead action level exceedance as well for the January through June 2015 monitoring period. Also, during yesterday's compliance training, OGWDW confirms that a system cannot hit the reset button when switching sources, so they will also have a treatment technique violation as I had indicated.

I think they only got about 80 of the required 100 compliance samples for lead/copper and that was on the last day of June. The number may change when they evaluate customer-requested samples. Based on the results they had in-house on June 30 (last day of compliance period) they were borderline on exceeding the lead action level, even without counting all of the relevant customer-requested samples from Tier 1 sites.

Do you think that we just want a line-by-line rebuttal or should we also be putting together a general statement about the Region's position on the Flint situation – like, Flint remains in compliance with its implementation of Federal LCR as currently written and implemented by MDEQ and/or that the Region's concerns are above and beyond the current regulatory implementation? Miguel, would that be correct?

Corrosive Impact: Leaded Water and One Flint Family's Toxic Nightmare

Jul 09 Posted by Curt Guyette in Democracy Watch

It took a while for LeeAnne Walters to realize the full impact of the number: 13,200.

Walters—a stay-at home mom with four sons and a husband in the Navy—had seen other numbers reflecting the quality of drinking water at her Flint home that were devastating. But 13,200? She'd never seen anything like this.

The city had tested her water twice in this past March and both times found dangerously high levels of lead—104 parts per billion (ppb) and 397 ppb, respectively.

Those numbers filled her with dread, because they meant her family had been exposed to high levels of a terribly toxic heavy metal that put her children's future in jeopardy.

But it was the result of a third test of the tap water in her home, performed by independent experts at Virginia Tech university, that most stunned Walters.

"It took a while for me to wrap my head around it," said Citizen name / Ex. 6

The VT researchers discovered lead levels i Citizen name / Ex. 6 ater reached a jaw-dropping 13,200 ppb—more than twice the amount at .S. Environmental Protection Agency classifies water as hazardous waste.

“When I saw those numbers I was shocked,” said Virginia Tech professor Marc Edwards, a former MacArthur Fellow and respected authority on corrosion in drinking-water systems, who oversaw the tests.

Edwards played a key role in discovering the problem of corroded water pipes and lead in Washington, D.C. drinking water during the early 2000s, in what has been described as one of the worst contamination events ever seen in an urban water system, with resulting increased incidence of childhood lead poisoning, miscarriages and fetal death.

In terms of lead levels, the Walters family’s numbers eclipsed even the worst D.C. homes.

“I have never in my 25-year career seen such outrageously high levels going into another home in the United States,” said Edwards. “This was literally hazardous-waste levels.”

But the condition of Walters’ tap water raises a much more far-reaching question: Since the city moved away from Detroit’s water system and began pumping water from the Flint River, how many other families have been put at risk by the city’s questionable testing procedures and handling of the water supply?

The Walters family surely isn’t alone in dealing with the threat of lead-laced drinking water. About half of Flint’s 40,000 homes are a half-century old or older, built at a time when water service lines were typically made of lead.

And according to various experts, including an EPA water-quality specialist, the city’s actions are only exacerbating the threat.

“What the public needs is accurate information,” explained Miguel Del Toral, regulations manager for the Ground Water and Drinking Water Branch of the EPA’s Region 5.

Instead, the city is utilizing testing measures that almost ensure that worst-case scenarios such as the one facing the Walters family escape detection, asserted Del Toral in an internal EPA memo provided to the ACLU of Michigan.

Compounding the threat is what Del Toral describes as the continued inability of officials to adequately treat water coming into people's homes from the Flint River.

"I don't want to scare people unnecessarily," said Del Toral in a phone interview from his home in Chicago. "But there is absolutely a problem in Flint that needs to be addressed right away."

During his interview with the ACLU of Michigan, Del Toral said he was willing to go on the record with his concerns, but that he was doing so as a private citizen, not as a representative of the EPA.

EPA rules, he said, required that such interviews be routed through the agency's public affairs people. But he's willing to speak out nonetheless, he said, because of the potential harm to the public is so great, and the need to address it is so urgent.

WATERING DOWN THE TESTS

Perhaps the most vexing problem in all of this is the contamination caused by the city's decades-old network of lead and iron pipes—a problem directly connected to the switch to river water, and the city's failure to adequately treat it.

Under the U.S. Environmental Protection Agency's rules, if lead reaches a level of 15 parts per billion in water, the source of the problem must be identified and corrected.

In early March, after months of requests (and only after Citizen name / Ex. 6 had received a doctor's note raising concerns about problems with the water), the city finally conducted a test. It found lead levels of 104 ppb the first time. A second test recorded a level of 397 ppb.

Blood tests, taken after those water-sample numbers were reported, revealed that one of her children, a four year old, had lead poisoning.

The news was devastating, said Walters, and the concern it creates for her child's future is haunting.

"Lead can affect almost every organ and system in your body," according to the EPA's web site. "Children six years old and younger are most susceptible … Even low levels of lead in the blood of children can result in: behavior and learning problems; lower IQ and hyperactivity; slowed growth; and hearing problems."

Those dangers made Citizen name / Ex. 6 all the more determined to get her questions answered.

For one thing, she wanted to know why residents were being instructed to "pre-flush" water lines before drawing samples that would be tested by the city

After much searching, she found Del Toral at the EPA's Region 5 in Chicago. He explained to her that her instincts were right, and that she had good cause to be concerned about the way testing was being done.

"The practice of pre-flushing before collecting compliance samples has been shown to result in the minimization of lead capture and significant underestimation of lead levels in drinking water," wrote Del Toral in an internal memo dated June 24.

Del Toral went on to say that the city's testing methods were a "serious concern" because they "could provide a false sense of security to the residents of Flint regarding lead levels in the water." As a result, he warned, residents could fail to take the necessary precautions to protect their families from lead in the drinking water.

Virginia Tech's Edwards completely agrees with Del Toral's assessment.

“The net effect of a ‘pre-flush’ is to greatly reduce the likelihood of detecting lead in samples collected … that would normally be present in the consumers drinking water,” Edwards wrote in an email. “I have long maintained that the practice should be banned, as it artificially lowers the amount of lead detected in samples versus typical consumer exposure.”

Asked about these concerns, city spokesman Jason Lorenz offered the following email reply: “While I cannot directly respond to Mr. Del Toral's remarks without first contacting the EPA Region 5 office, I can say that the City of Flint follows all the testing procedures and schedules as required by the U.S. EPA.”

He added that the Michigan Department of Environmental Quality (MDEQ) endorses the city’s sampling method. The MDEQ did not respond to phone calls and e-mails seeking its comments on the controversy.

Del Toral contended in an interview that what Flint’s doing is actually exploiting a “loophole” in the law.

“From a technical standpoint, there’s no justification for the way Flint is conducting its tests,” Del Toral said. “Any credible scientist will tell you [the city’s] method is not the way to catch worst-case conditions.”

There is no legitimate reason for the city’s methodology, said Del Toral.

EPA rules, he said, required that such interviews be routed through the agency’s public affairs people. But he was willing to speak out nonetheless, he said, because of the potential harm to the public.

FLUSHING OUT REAL ANSWERS

It was Del Toral who, after determining that the lead problem plaguing the Citizen name / Ex. 6 family was coming from outside their home, connected Citizen name / Ex. 6 with Edwards at Virginia Tech.

Instead of taking a single sample after a line had been “pre-flushed” under the city’s direction, Edwards instructed Walters to collect a series of samples from water that had been allowed to sit in the service line long enough to accurately reflect levels the family could be exposed to under normal use.

(Meanwhile, that same service line, dug up and replaced after the sample collection, was found to be made of lead in one section and iron in another.)

Edwards tested the water and discovered that the lead contamination ranged from 200 ppb to the 13,200 ppb figure that stunned **Citizen name / Ex. 6**—and should likewise shock many others.

Given the age of much of Flint’s infrastructure, Edwards agrees with Del Toral’s assessment that the test results they found at the Walters home amount to an alarm going off, and others in the city need to pay attention.

“I do not see any reason why there would not be serious problems occurring in at least some other Flint homes,” said Edwards.

In 1986, the U.S. Safe Drinking Water Act was amended to prohibit the use of lead pipes in public water systems. Every house built before that is potentially at risk, said Edwards. About half of Flint’s roughly 40,000 homes are at least 50 years old.

Making things worse is the fact that the high levels of chlorine being used to treat Flint’s dirty river water lead to the creation of a carcinogenic byproduct know as total trihalomethanes, or TTHM. To keep TTHM levels down, the city is adding ferric chloride. The trouble is, that additive can also accelerate the corrosion of lead and iron pipes.

Adding yet another layer to the problem is something the city is not doing.

According to Del Toral, Flint should be adding corrosion-control chemicals designed to help keep lead and copper in pipes from leaching into drinking water. Doing so is required by federal regulations, wrote Del Toral in his memo.

“To our knowledge, that is inaccurate,” said Flint spokesman Lorenz. “Before the plant was placed in operation, the City (and our engineering firm) had numerous discussions with DEQ personnel and inquired if corrosion-control chemicals – typically phosphates --needed to be included in the treatment process. The use of these chemicals was not required or mandated.”

What’s indisputable is this:

Flint’s water contained corrosion-control chemicals until April 2014, when Flint’s ties to the Detroit water system were severed. Flint officials hailed that changeover as a cost-cutting move for a city facing a financial crisis so severe it had been placed under the control of a state-appointed emergency manager.

Discontinuing the use of the anti-corrosion chemicals allowed toxic scale built up on the insides of pipes over the past decades to be released into water flowing into people’s homes, explained Del Toral.

In his memo, Del Toral warned: “The lack of mitigating treatment is especially concerning as the high lead levels [that result] will likely not be reflected in the City of Flint’s compliance samples due to sampling procedures used…”

In other words, at the same time the city is exacerbating the problem, it’s conducting tests that will probably fail to identify the true extent of the threat.

Del Toral described the situation as a “major concern.”

“In the absence of any corrosion control treatment, lead levels in drinking water can be expected to increase,” he warned in his memo.

The EPA offered Flint officials the use of agency experts to help get the situation under control, said Del Toral, but added that, to his knowledge, the city has so far declined all help.

Citizen name / Ex. 6 said that when she asked why city officials weren't taking the EPA's offer of assistance, she was told, "We don't need it."

Flint spokesman Lorenz, on the other hand, maintained that "the city continues to work closely with the MDEQ and the EPA Regional Office."

As for Walters's family, that the city has finally replaced the service line leading to their home, and lead levels have dropped below the 15 ppb EPA action level.

The problem now, she said, is that water currently coming out of her tap tinged yellow and smells of rotten eggs. City officials have given her no explanation as to the possible cause of that.

It is just one more in a long list of questions that need to be addressed.

"What we need," said Citizen name / Ex. 6 "are more answers."

But it's not just answers the people of Flint require.

They also need solutions. And, as Del Toral's EPA memo emphasizes, they need them immediately.

Corrosive Impact: Leaded Water and One Flint Family's Toxic Nightmare

Jul 09 Posted by Curt Guyette in Democracy Watch

It took a while for LeeAnne Walters to realize the full impact of the number: 13,200.

Walters—a stay-at home mom with four sons and a husband in the Navy—had seen other numbers reflecting the quality of drinking water at her Flint home that were devastating. But 13,200? She'd never seen anything like this.

The city had tested her water twice in this past March and both times found dangerously high levels of lead—104 parts per billion (ppb) and 397 ppb, respectively.

Those numbers filled her with dread, because they meant her family had been exposed to high levels of a terribly toxic heavy metal that put her children's future in jeopardy.

But it was the result of a third test of the tap water in her home, performed by independent experts at Virginia Tech university, that most stunned Walters.

"It took a while for me to wrap my head around it," said Walters.

The VT researchers discovered lead levels in Walters' water reached a jaw-dropping 13,200 ppb—more than twice the amount at which the U.S. Environmental Protection Agency classifies water as hazardous waste.

“When I saw those numbers I was shocked,” said Virginia Tech professor Marc Edwards, a former MacArthur Fellow and respected authority on corrosion in drinking-water systems, who oversaw the tests.

Edwards played a key role in discovering the problem of corroded water pipes and lead in Washington, D.C. drinking water during the early 2000s, in what has been described as one of the worst contamination events ever seen in an urban water system, with resulting increased incidence of childhood lead poisoning, miscarriages and fetal death.

In terms of lead levels, the Walters family’s numbers eclipsed even the worst D.C. homes.

“I have never in my 25-year career seen such outrageously high levels going into another home in the United States,” said Edwards. “This was literally hazardous-waste levels.”

But the condition of Walters’ tap water raises a much more far-reaching question: Since the city moved away from Detroit’s water system and began pumping water from the Flint River, how many other families have been put at risk by the city’s questionable testing procedures and handling of the water supply?

The Walters family surely isn’t alone in dealing with the threat of lead-laced drinking water. About half of Flint’s 40,000 homes are a half-century old or older, built at a time when water service lines were typically made of lead.

And according to various experts, including an EPA water-quality specialist, the city’s actions are only exacerbating the threat.

“What the public needs is accurate information,” explained Miguel Del Toral, regulations manager for the Ground Water and Drinking Water Branch of the EPA’s Region 5.

Instead, the city is utilizing testing measures that almost ensure that worst-case scenarios such as the one facing the Walters family escape detection, asserted Del Toral in an internal EPA memo provided to the ACLU of Michigan.

Compounding the threat is what Del Toral describes as the continued inability of officials to adequately treat water coming into people's homes from the Flint River.

"I don't want to scare people unnecessarily," said Del Toral in a phone interview from his home in Chicago. "But there is absolutely a problem in Flint that needs to be addressed right away."

During his interview with the ACLU of Michigan, Del Toral said he was willing to go on the record with his concerns, but that he was doing so as a private citizen, not as a representative of the EPA.

EPA rules, he said, required that such interviews be routed through the agency's public affairs people. But he's willing to speak out nonetheless, he said, because of the potential harm to the public is so great, and the need to address it is so urgent.

WATERING DOWN THE TESTS

Perhaps the most vexing problem in all of this is the contamination caused by the city's decades-old network of lead and iron pipes—a problem directly connected to the switch to river water, and the city's failure to adequately treat it.

Under the U.S. Environmental Protection Agency's rules, if lead reaches a level of 15 parts per billion in water, the source of the problem must be identified and corrected.

In early March, after months of requests (and only after Walters had received a doctor's note raising concerns about problems with the water), the city finally conducted a test. It found lead levels of 104 ppb the first time. A second test recorded a level of 397 ppb.

Blood tests, taken after those water-sample numbers were reported, revealed that one of her children, a four year old, had lead poisoning.

The news was devastating, said Walters, and the concern it creates for her child's future is haunting.

"Lead can affect almost every organ and system in your body," according to the EPA's web site. "Children six years old and younger are most susceptible … Even low levels of lead in the blood of children can result in: behavior and learning problems; lower IQ and hyperactivity; slowed growth; and hearing problems."

Those dangers made Walters all the more determined to get her questions answered.

For one thing, she wanted to know why residents were being instructed to "pre-flush" water lines before drawing samples that would be tested by the city

After much searching, she found Del Toral at the EPA's Region 5 in Chicago. He explained to her that her instincts were right, and that she had good cause to be concerned about the way testing was being done.

"The practice of pre-flushing before collecting compliance samples has been shown to result in the minimization of lead capture and significant underestimation of lead levels in drinking water," wrote Del Toral in an internal memo dated June 24.

Del Toral went on to say that the city's testing methods were a "serious concern" because they "could provide a false sense of security to the residents of Flint regarding lead levels in the water." As a result, he warned, residents could fail to take the necessary precautions to protect their families from lead in the drinking water.

Virginia Tech's Edwards completely agrees with Del Toral's assessment.

“The net effect of a ‘pre-flush’ is to greatly reduce the likelihood of detecting lead in samples collected … that would normally be present in the consumers drinking water,” Edwards wrote in an email. “I have long maintained that the practice should be banned, as it artificially lowers the amount of lead detected in samples versus typical consumer exposure.”

Asked about these concerns, city spokesman Jason Lorenz offered the following email reply: “While I cannot directly respond to Mr. Del Toral's remarks without first contacting the EPA Region 5 office, I can say that the City of Flint follows all the testing procedures and schedules as required by the U.S. EPA.”

He added that the Michigan Department of Environmental Quality (MDEQ) endorses the city’s sampling method. The MDEQ did not respond to phone calls and e-mails seeking its comments on the controversy.

Del Toral contended in an interview that what Flint’s doing is actually exploiting a “loophole” in the law.

“From a technical standpoint, there’s no justification for the way Flint is conducting its tests,” Del Toral said. “Any credible scientist will tell you [the city’s] method is not the way to catch worst-case conditions.”

There is no legitimate reason for the city’s methodology, said Del Toral.

EPA rules, he said, required that such interviews be routed through the agency’s public affairs people. But he was willing to speak out nonetheless, he said, because of the potential harm to the public.

FLUSHING OUT REAL ANSWERS

It was Del Toral who, after determining that the lead problem plaguing the Walters family was coming from outside their home, connected LeeAnne with Edwards at Virginia Tech.

Instead of taking a single sample after a line had been "pre-flushed" under the city's direction, Edwards instructed Walters to collect a series of samples from water that had been allowed to sit in the service line long enough to accurately reflect levels the family could be exposed to under normal use.

(Meanwhile, that same service line, dug up and replaced after the sample collection, was found to be made of lead in one section and iron in another.)

Edwards tested the water and discovered that the lead contamination ranged from 200 ppb to the 13,200 ppb figure that stunned LeeAnne Walters—and should likewise shock many others.

Given the age of much of Flint's infrastructure, Edwards agrees with Del Toral's assessment that the test results they found at the Walters home amount to an alarm going off, and others in the city need to pay attention.

"I do not see any reason why there would not be serious problems occurring in at least some other Flint homes," said Edwards.

In 1986, the U.S. Safe Drinking Water Act was amended to prohibit the use of lead pipes in public water systems. Every house built before that is potentially at risk, said Edwards. About half of Flint's roughly 40,000 homes are at least 50 years old.

Making things worse is the fact that the high levels of chlorine being used to treat Flint's dirty river water lead to the creation of a carcinogenic byproduct know as total trihalomethanes, or TTHM. To keep TTHM levels down, the city is adding ferric chloride. The trouble is, that additive can also accelerate the corrosion of lead and iron pipes.

Adding yet another layer to the problem is something the city is not doing.

According to Del Toral, Flint should be adding corrosion-control chemicals designed to help keep lead and copper in pipes from leaching into drinking water. Doing so is required by federal regulations, wrote Del Toral in his memo.

“To our knowledge, that is inaccurate,” said Flint spokesman Lorenz. “Before the plant was placed in operation, the City (and our engineering firm) had numerous discussions with DEQ personnel and inquired if corrosion-control chemicals – typically phosphates --needed to be included in the treatment process. The use of these chemicals was not required or mandated.”

What’s indisputable is this:

Flint’s water contained corrosion-control chemicals until April 2014, when Flint’s ties to the Detroit water system were severed. Flint officials hailed that changeover as a cost-cutting move for a city facing a financial crisis so severe it had been placed under the control of a state-appointed emergency manager.

Discontinuing the use of the anti-corrosion chemicals allowed toxic scale built up on the insides of pipes over the past decades to be released into water flowing into people’s homes, explained Del Toral.

In his memo, Del Toral warned: “The lack of mitigating treatment is especially concerning as the high lead levels [that result] will likely not be reflected in the City of Flint’s compliance samples due to sampling procedures used…”

In other words, at the same time the city is exacerbating the problem, it’s conducting tests that will probably fail to identify the true extent of the threat.

Del Toral described the situation as a “major concern.”

“In the absence of any corrosion control treatment, lead levels in drinking water can be expected to increase,” he warned in his memo.

The EPA offered Flint officials the use of agency experts to help get the situation under control, said Del Toral, but added that, to his knowledge, the city has so far declined all help.

LeeAnne Walters said that when she asked why city officials weren’t taking the EPA’s offer of assistance, she was told, “We don’t need it.”

Flint spokesman Lorenz, on the other hand, maintained that “the city continues to work closely with the MDEQ and the EPA Regional Office.”

As for Walters’s family, that the city has finally replaced the service line leading to their home, and lead levels have dropped below the 15 ppb EPA action level.

The problem now, she said, is that water currently coming out of her tap tinged yellow and smells of rotten eggs. City officials have given her no explanation as to the possible cause of that.

It is just one more in a long list of questions that need to be addressed.

“What we need,” said Walters, “are more answers.”

But it’s not just answers the people of Flint require.

They also need solutions. And, as Del Toral’s EPA memo emphasizes, they need them immediately.

Rita – in response to your question, Susan asked for this:

"Please ask WD to prepare a concise list of the inaccuracies -- and then we can determine whether to request a correction."

So that should be the starting point.

We can send the annotation Miguel drafted to Susan, but I think we also need to digest it into a list of specific items that would go into a transmittal message. Please do that.

Do you think that we just want a line-by-line rebuttal or should we also be putting together a general statement about the Region's position on the Flint situation – like, Flint remains in compliance with its implementation of Federal LCR as currently written and implemented by MDEQ and/or that the Region's concerns are above and beyond the current regulatory implementation? Miguel, would that be correct?

Corrosive Impact: Leaded Water and One Flint Family's Toxic Nightmare

Jul 09 Posted by Curt Guyette in Democracy Watch

It took a while for LeeAnne Walters to realize the full impact of the number: 13,200.

Walters—a stay-at home mom with four sons and a husband in the Navy—had seen other numbers reflecting the quality of drinking water at her Flint home that were devastating. But 13,200? She'd never seen anything like this.

The city had tested her water twice in this past March and both times found dangerously high levels of lead—104 parts per billion (ppb) and 397 ppb, respectively.

Those numbers filled her with dread, because they meant her family had been exposed to high levels of a terribly toxic heavy metal that put her children's future in jeopardy.

But it was the result of a third test of the tap water in her home, performed by independent experts at Virginia Tech university, that most stunned Walters.

"It took a while for me to wrap my head around it," said Walters.

The VT researchers discovered lead levels in Walters' water reached a jaw-dropping 13,200 ppb—more than twice the amount at which the U.S. Environmental Protection Agency classifies water as hazardous waste.

"When I saw those numbers I was shocked," said Virginia Tech professor Marc Edwards, a former MacArthur Fellow and respected authority on corrosion in drinking-water systems, who oversaw the tests.

Edwards played a key role in discovering the problem of corroded water pipes and lead in Washington, D.C. drinking water during the early 2000s, in what has been described as one of the worst contamination events ever seen in an urban water system, with resulting increased incidence of childhood lead poisoning, miscarriages and fetal death.

In terms of lead levels, the Walters family's numbers eclipsed even the worst D.C. homes.

"I have never in my 25-year career seen such outrageously high levels going into another home in the United States," said Edwards. "This was literally hazardous-waste levels."

But the condition of Walters' tap water raises a much more far-reaching question: Since the city moved away from Detroit's water system and began pumping water from the Flint River, how many other families have been put at risk by the city's questionable testing procedures and handling of the water supply?

The Walters family surely isn't alone in dealing with the threat of lead-laced drinking water. About half of Flint's 40,000 homes are a half-century old or older, built at a time when water service lines were typically made of lead.

And according to various experts, including an EPA water-quality specialist, the city's actions are only exacerbating the threat.

“What the public needs is accurate information,” explained Miguel Del Toral, regulations manager for the Ground Water and Drinking Water Branch of the EPA’s Region 5.

Instead, the city is utilizing testing measures that almost ensure that worst-case scenarios such as the one facing the Walters family escape detection, asserted Del Toral in an internal EPA memo provided to the ACLU of Michigan.

Compounding the threat is what Del Toral describes as the continued inability of officials to adequately treat water coming into people’s homes from the Flint River.

“I don’t want to scare people unnecessarily,” said Del Toral in a phone interview from his home in Chicago. “But there is absolutely a problem in Flint that needs to be addressed right away.”

During his interview with the ACLU of Michigan, Del Toral said he was willing to go on the record with his concerns, but that he was doing so as a private citizen, not as a representative of the EPA.

EPA rules, he said, required that such interviews be routed through the agency’s public affairs people. But he’s willing to speak out nonetheless, he said, because of the potential harm to the public is so great, and the need to address it is so urgent.

WATERING DOWN THE TESTS

Perhaps the most vexing problem in all of this is the contamination caused by the city’s decades-old network of lead and iron pipes—a problem directly connected to the switch to river water, and the city’s failure to adequately treat it.

Under the U.S. Environmental Protection Agency’s rules, if lead reaches a level of 15 parts per billion in water, the source of the problem must be identified and corrected.

In early March, after months of requests (and only after Walters had received a doctor's note raising concerns about problems with the water), the city finally conducted a test. It found lead levels of 104 ppb the first time. A second test recorded a level of 397 ppb.

Blood tests, taken after those water-sample numbers were reported, revealed that one of her children, a four year old, had lead poisoning.

The news was devastating, said Walters, and the concern it creates for her child's future is haunting.

"Lead can affect almost every organ and system in your body," according to the EPA's web site. "Children six years old and younger are most susceptible … Even low levels of lead in the blood of children can result in: behavior and learning problems; lower IQ and hyperactivity; slowed growth; and hearing problems."

Those dangers made Walters all the more determined to get her questions answered.

For one thing, she wanted to know why residents were being instructed to "pre-flush" water lines before drawing samples that would be tested by the city

After much searching, she found Del Toral at the EPA's Region 5 in Chicago. He explained to her that her instincts were right, and that she had good cause to be concerned about the way testing was being done.

"The practice of pre-flushing before collecting compliance samples has been shown to result in the minimization of lead capture and significant underestimation of lead levels in drinking water," wrote Del Toral in an internal memo dated June 24.

Del Toral went on to say that the city's testing methods were a "serious concern" because they "could provide a false sense of security to the residents of Flint regarding lead levels in the water." As a result, he warned, residents could fail to take the necessary precautions to protect their families from lead in the drinking water.

Virginia Tech's Edwards completely agrees with Del Toral's assessment.

"The net effect of a 'pre-flush' is to greatly reduce the likelihood of detecting lead in samples collected … that would normally be present in the consumers drinking water," Edwards wrote in an email. "I have long maintained that the practice should be banned, as it artificially lowers the amount of lead detected in samples versus typical consumer exposure."

Asked about these concerns, city spokesman Jason Lorenz offered the following email reply: "While I cannot directly respond to Mr. Del Toral's remarks without first contacting the EPA Region 5 office, I can say that the City of Flint follows all the testing procedures and schedules as required by the U.S. EPA."

He added that the Michigan Department of Environmental Quality (MDEQ) endorses the city's sampling method. The MDEQ did not respond to phone calls and e-mails seeking its comments on the controversy.

Del Toral contended in an interview that what Flint's doing is actually exploiting a "loophole" in the law.

"From a technical standpoint, there's no justification for the way Flint is conducting its tests," Del Toral said. "Any credible scientist will tell you [the city's] method is not the way to catch worst-case conditions."

There is no legitimate reason for the city's methodology, said Del Toral.

EPA rules, he said, required that such interviews be routed through the agency's public affairs people. But he was willing to speak out nonetheless, he said, because of the potential harm to the public.

FLUSHING OUT REAL ANSWERS

It was Del Toral who, after determining that the lead problem plaguing the Walters family was coming from outside their home, connected LeeAnne with Edwards at Virginia Tech.

Instead of taking a single sample after a line had been “pre-flushed” under the city’s direction, Edwards instructed Walters to collect a series of samples from water that had been allowed to sit in the service line long enough to accurately reflect levels the family could be exposed to under normal use.

(Meanwhile, that same service line, dug up and replaced after the sample collection, was found to be made of lead in one section and iron in another.)

Edwards tested the water and discovered that the lead contamination ranged from 200 ppb to the 13,200 ppb figure that stunned LeeAnne Walters—and should likewise shock many others.

Given the age of much of Flint’s infrastructure, Edwards agrees with Del Toral’s assessment that the test results they found at the Walters home amount to an alarm going off, and others in the city need to pay attention.

“I do not see any reason why there would not be serious problems occurring in at least some other Flint homes,” said Edwards.

In 1986, the U.S. Safe Drinking Water Act was amended to prohibit the use of lead pipes in public water systems. Every house built before that is potentially at risk, said Edwards. About half of Flint’s roughly 40,000 homes are at least 50 years old.

Making things worse is the fact that the high levels of chlorine being used to treat Flint’s dirty river water lead to the creation of a carcinogenic byproduct know as total trihalomethanes, or TTHM. To keep TTHM levels down, the city is adding ferric chloride. The trouble is, that additive can also accelerate the corrosion of lead and iron pipes.

Adding yet another layer to the problem is something the city is not doing.

According to Del Toral, Flint should be adding corrosion-control chemicals designed to help keep lead and copper in pipes from leaching into drinking water. Doing so is required by federal regulations, wrote Del Toral in his memo.

“To our knowledge, that is inaccurate,” said Flint spokesman Lorenz. “Before the plant was placed in operation, the City (and our engineering firm) had numerous discussions with DEQ personnel and inquired if corrosion-control chemicals – typically phosphates --needed to be included in the treatment process. The use of these chemicals was not required or mandated.”

What’s indisputable is this:

Flint’s water contained corrosion-control chemicals until April 2014, when Flint’s ties to the Detroit water system were severed. Flint officials hailed that changeover as a cost-cutting move for a city facing a financial crisis so severe it had been placed under the control of a state-appointed emergency manager.

Discontinuing the use of the anti-corrosion chemicals allowed toxic scale built up on the insides of pipes over the past decades to be released into water flowing into people’s homes, explained Del Toral.

In his memo, Del Toral warned: “The lack of mitigating treatment is especially concerning as the high lead levels [that result] will likely not be reflected in the City of Flint’s compliance samples due to sampling procedures used…”

In other words, at the same time the city is exacerbating the problem, it’s conducting tests that will probably fail to identify the true extent of the threat.

Del Toral described the situation as a “major concern.”

“In the absence of any corrosion control treatment, lead levels in drinking water can be expected to increase,” he warned in his memo.

The EPA offered Flint officials the use of agency experts to help get the situation under control, said Del Toral, but added that, to his knowledge, the city has so far declined all help.

LeeAnne Walters said that when she asked why city officials weren’t taking the EPA’s offer of assistance, she was told, “We don’t need it.”

Flint spokesman Lorenz, on the other hand, maintained that “the city continues to work closely with the MDEQ and the EPA Regional Office.”

As for Walters’s family, that the city has finally replaced the service line leading to their home, and lead levels have dropped below the 15 ppb EPA action level.

The problem now, she said, is that water currently coming out of her tap tinged yellow and smells of rotten eggs. City officials have given her no explanation as to the possible cause of that.

It is just one more in a long list of questions that need to be addressed.

“What we need,” said Walters, “are more answers.”

But it’s not just answers the people of Flint require.

They also need solutions. And, as Del Toral's EPA memo emphasizes, they need them immediately.

Personal Matters / Ex. 6

All,

I did not want to talk about this, but I feel I have to at this point.

Personal Matters / Ex. 6

Personal Matters / Ex. 6 Folks want me to get the report done and keep MDEQ in the loop (and hurry up) and also finish the state primacy reviews (and hurry up). Again, it's not the workload, but these things take time. The Chicago study took a long time to put together and folks all over the place use it now.

So I am asked to expedite the report. I knew I could not finish it and decided on an interim report and stepped on the first landmine, following by immediately stepping on another landmine in releasing the report. Personal Matters / Ex. 6 There's no time to think and that's how mistakes happen. Good intentions on my part, but mistakes in the end.

I am trying to get the final report done, but there is no way I can do it today. Personal Matters / Ex. 6 Personal Matters / Ex. 6 Personal Matters / Ex. 6 I am really trying to finish this up, and now I am asked to produce it by COB. I cannot, and if I rush this (again) my fear is that I am going to step on another landmine. Last night I had similar reservations about responding to the ACLU article, Personal Matters / Ex. 6 Personal Matters / Ex. 6

At a minimum, I can provide a short bullet-point summary and get that to you and hopefully make revisions to it before COB today or at the latest, by Monday morning. Please let me know if that is acceptable.

Respectfully,

Miguel A. Del Toral

Jul 09 Posted by Curt Guyette in Democracy Watch

It took a while for Citizen name / Ex. 6 to realize the full impact of the number: 13,200.

Citizen name / Ex. 6—a stay-at home mom with four sons and a husband in the Navy—had seen other numbers reflecting the quality of drinking water at her Flint home that were devastating. But 13,200? She'd never seen anything like this.

The city had tested her water twice in this past March and both times found dangerously high levels of lead—104 parts per billion (ppb) and 397 ppb, respectively.

Those numbers filled her with dread, because they meant her family had been exposed to high levels of a terribly toxic heavy metal that put her children's future in jeopardy.

But it was the result of a third test of the tap water in her home, performed by independent experts at Virginia Tech university, that most stunned Walters.

"It took a while for me to wrap my head around it," said Citizen name / Ex. 6

The VT researchers discovered lead levels in Walters' water reached a jaw-dropping 13,200 ppb—more than twice the amount at which the U.S. Environmental Protection Agency classifies water as hazardous waste.

"When I saw those numbers I was shocked," said Virginia Tech professor Marc Edwards, a former MacArthur Fellow and respected authority on corrosion in drinking-water systems, who oversaw the tests.

Edwards played a key role in discovering the problem of corroded water pipes and lead in Washington, D.C. drinking water during the early 2000s, in what has been described as one of the worst contamination events ever seen in an urban water system, with resulting increased incidence of childhood lead poisoning, miscarriages and fetal death.

In terms of lead levels, the Walters family's numbers eclipsed even the worst D.C. homes.

"I have never in my 25-year career seen such outrageously high levels going into another home in the United States," said Edwards. "This was literally hazardous-waste levels."

But the condition of Walters' tap water raises a much more far-reaching question: Since the city moved away from Detroit's water system and began pumping water from the Flint River, how many other families have been put at risk by the city's questionable testing procedures and handling of the water supply?

The Citizen name / Ex. 6 family surely isn't alone in dealing with the threat of lead-laced drinking water. About half of Flint's 40,000 homes are a half-century old or older, built at a time when water service lines were typically made of lead.

And according to various experts, including an EPA water-quality specialist, the city's actions are only exacerbating the threat.

"What the public needs is accurate information," explained Miguel Del Toral, regulations manager for the Ground Water and Drinking Water Branch of the EPA's Region 5.

Instead, the city is utilizing testing measures that almost ensure that worst-case scenarios such as the one facing the Walters family escape detection, asserted Del Toral in an internal EPA memo provided to the ACLU of Michigan.

Compounding the threat is what Del Toral describes as the continued inability of officials to adequately treat water coming into people's homes from the Flint River.

“I don’t want to scare people unnecessarily,” said Del Toral in a phone interview from his home in Chicago. “But there is absolutely a problem in Flint that needs to be addressed right away.”

During his interview with the ACLU of Michigan, Del Toral said he was willing to go on the record with his concerns, but that he was doing so as a private citizen, not as a representative of the EPA.

EPA rules, he said, required that such interviews be routed through the agency’s public affairs people. But he’s willing to speak out nonetheless, he said, because of the potential harm to the public is so great, and the need to address it is so urgent.

WATERING DOWN THE TESTS

Perhaps the most vexing problem in all of this is the contamination caused by the city’s decades-old network of lead and iron pipes—a problem directly connected to the switch to river water, and the city’s failure to adequately treat it.

Under the U.S. Environmental Protection Agency’s rules, if lead reaches a level of 15 parts per billion in water, the source of the problem must be identified and corrected.

In early March, after months of requests (and only after Walters had received a doctor’s note raising concerns about problems with the water), the city finally conducted a test. It found lead levels of 104 ppb the first time. A second test recorded a level of 397 ppb.

Blood tests, taken after those water-sample numbers were reported, revealed that one of her children, a four year old, had lead poisoning.

The news was devastating, said Citizen name / Ex. 6 and the concern it creates for her child’s future is haunting.

“Lead can affect almost every organ and system in your body,” according to the EPA’s web site. “Children six years old and younger are most susceptible … Even low levels of lead in the blood of children can result in: behavior and learning problems; lower IQ and hyperactivity; slowed growth; and hearing problems.”

Those dangers made Citizen name / Ex. 6 all the more determined to get her questions answered.

For one thing, she wanted to know why residents were being instructed to “pre-flush” water lines before drawing samples that would be tested by the city

After much searching, she found Del Toral at the EPA’s Region 5 in Chicago. He explained to her that her instincts were right, and that she had good cause to be concerned about the way testing was being done.

“The practice of pre-flushing before collecting compliance samples has been shown to result in the minimization of lead capture and significant underestimation of lead levels in drinking water,” wrote Del Toral in an internal memo dated June 24.

Del Toral went on to say that the city’s testing methods were a “serious concern” because they “could provide a false sense of security to the residents of Flint regarding lead levels in the water.” As a result, he warned, residents could fail to take the necessary precautions to protect their families from lead in the drinking water.

Virginia Tech’s Edwards completely agrees with Del Toral’s assessment.

“The net effect of a ‘pre-flush’ is to greatly reduce the likelihood of detecting lead in samples collected … that would normally be present in the consumers drinking water,” Edwards wrote in an email. “I have long maintained that the practice should be banned, as it artificially lowers the amount of lead detected in samples versus typical consumer exposure.”

Asked about these concerns, city spokesman Jason Lorenz offered the following email reply: “While I cannot directly respond to Mr. Del Toral's remarks without first contacting the EPA Region 5 office, I can say that the City of Flint follows all the testing procedures and schedules as required by the U.S. EPA.”

He added that the Michigan Department of Environmental Quality (MDEQ) endorses the city’s sampling method. The MDEQ did not respond to phone calls and e-mails seeking its comments on the controversy.

Del Toral contended in an interview that what Flint’s doing is actually exploiting a “loophole” in the law.

“From a technical standpoint, there’s no justification for the way Flint is conducting its tests,” Del Toral said. “Any credible scientist will tell you [the city’s] method is not the way to catch worst-case conditions.”

There is no legitimate reason for the city’s methodology, said Del Toral.

EPA rules, he said, required that such interviews be routed through the agency’s public affairs people. But he was willing to speak out nonetheless, he said, because of the potential harm to the public.

FLUSHING OUT REAL ANSWERS

It was Del Toral who, after determining that the lead problem plaguing the Citizen name / Ex. 6 family was coming from outside their home, connected Citizen name / Ex. 6 with Edwards at Virginia Tech.

Instead of taking a single sample after a line had been “pre-flushed” under the city’s direction, Edwards instructed Walters to collect a series of samples from water that had been allowed to sit in the service line long enough to accurately reflect levels the family could be exposed to under normal use.

(Meanwhile, that same service line, dug up and replaced after the sample collection, was found to be made of lead in one section and iron in another.)

Edwards tested the water and discovered that the lead contamination ranged from 200 ppb to the 13,200 ppb figure that stunned Citizen name / Ex. 6 —and should likewise shock many others.

Given the age of much of Flint's infrastructure, Edwards agrees with Del Toral's assessment that the test results they found at the Citizen name / Ex. 6 home amount to an alarm going off, and others in the city need to pay attention.

"I do not see any reason why there would not be serious problems occurring in at least some other Flint homes," said Edwards.

In 1986, the U.S. Safe Drinking Water Act was amended to prohibit the use of lead pipes in public water systems. Every house built before that is potentially at risk, said Edwards. About half of Flint's roughly 40,000 homes are at least 50 years old.

Making things worse is the fact that the high levels of chlorine being used to treat Flint's dirty river water lead to the creation of a carcinogenic byproduct know as total trihalomethanes, or TTHM. To keep TTHM levels down, the city is adding ferric chloride. The trouble is, that additive can also accelerate the corrosion of lead and iron pipes.

Adding yet another layer to the problem is something the city is not doing.

According to Del Toral, Flint should be adding corrosion-control chemicals designed to help keep lead and copper in pipes from leaching into drinking water. Doing so is required by federal regulations, wrote Del Toral in his memo.

"To our knowledge, that is inaccurate," said Flint spokesman Lorenz. "Before the plant was placed in operation, the City (and our engineering firm) had numerous discussions with DEQ personnel and inquired if corrosion-control chemicals – typically phosphates --needed to be included in the treatment process. The use of these chemicals was not required or mandated."

What's indisputable is this:

Flint's water contained corrosion-control chemicals until April 2014, when Flint's ties to the Detroit water system were severed. Flint officials hailed that changeover as a cost-cutting move for a city facing a financial crisis so severe it had been placed under the control of a state-appointed emergency manager.

Discontinuing the use of the anti-corrosion chemicals allowed toxic scale built up on the insides of pipes over the past decades to be released into water flowing into people's homes, explained Del Toral.

In his memo, Del Toral warned: "The lack of mitigating treatment is especially concerning as the high lead levels [that result] will likely not be reflected in the City of Flint's compliance samples due to sampling procedures used…"

In other words, at the same time the city is exacerbating the problem, it's conducting tests that will probably fail to identify the true extent of the threat.

Del Toral described the situation as a "major concern."

"In the absence of any corrosion control treatment, lead levels in drinking water can be expected to increase," he warned in his memo.

The EPA offered Flint officials the use of agency experts to help get the situation under control, said Del Toral, but added that, to his knowledge, the city has so far declined all help.

Citizen name / Ex. 6 said that when she asked why city officials weren't taking the EPA's offer of assistance, she was told, "We don't need it."

Flint spokesman Lorenz, on the other hand, maintained that “the city continues to work closely with the MDEQ and the EPA Regional Office.”

As for Citizen name / Ex. 6 family, that the city has finally replaced the service line leading to their home, and lead levels have dropped below the 15 ppb EPA action level.

The problem now, she said, is that water currently coming out of her tap tinged yellow and smells of rotten eggs. City officials have given her no explanation as to the possible cause of that.

It is just one more in a long list of questions that need to be addressed.

“What we need,” said Citizen name / Ex. 6 “are more answers.”

But it’s not just answers the people of Flint require.

They also need solutions. And, as Del Toral’s EPA memo emphasizes, they need them immediately.

Jul 09 Posted by Curt Guyette in Democracy Watch

It took a while for LeeAnne Walters to realize the full impact of the number: 13,200.

Walters—a stay-at home mom with four sons and a husband in the Navy—had seen other numbers reflecting the quality of drinking water at her Flint home that were devastating. But 13,200? She'd never seen anything like this.

The city had tested her water twice in this past March and both times found dangerously high levels of lead—104 parts per billion (ppb) and 397 ppb, respectively.

Those numbers filled her with dread, because they meant her family had been exposed to high levels of a terribly toxic heavy metal that put her children's future in jeopardy.

But it was the result of a third test of the tap water in her home, performed by independent experts at Virginia Tech university, that most stunned Walters.

"It took a while for me to wrap my head around it," said Walters.

The VT researchers discovered lead levels in Walters' water reached a jaw-dropping 13,200 ppb—more than twice the amount at which the U.S. Environmental Protection Agency classifies water as hazardous waste.

"When I saw those numbers I was shocked," said Virginia Tech professor Marc Edwards, a former MacArthur Fellow and respected authority on corrosion in drinking-water systems, who oversaw the tests.

Edwards played a key role in discovering the problem of corroded water pipes and lead in Washington, D.C. drinking water during the early 2000s, in what has been described as one of the worst contamination events ever seen in an urban water system, with resulting increased incidence of childhood lead poisoning, miscarriages and fetal death.

In terms of lead levels, the Walters family's numbers eclipsed even the worst D.C. homes.

"I have never in my 25-year career seen such outrageously high levels going into another home in the United States," said Edwards. "This was literally hazardous-waste levels."

But the condition of Walters' tap water raises a much more far-reaching question: Since the city moved away from Detroit's water system and began pumping water from the Flint River, how many other families have been put at risk by the city's questionable testing procedures and handling of the water supply?

The Walters family surely isn't alone in dealing with the threat of lead-laced drinking water. About half of Flint's 40,000 homes are a half-century old or older, built at a time when water service lines were typically made of lead.

And according to various experts, including an EPA water-quality specialist, the city's actions are only exacerbating the threat.

"What the public needs is accurate information," explained Miguel Del Toral, regulations manager for the Ground Water and Drinking Water Branch of the EPA's Region 5.

Instead, the city is utilizing testing measures that almost ensure that worst-case scenarios such as the one facing the Walters family escape detection, asserted Del Toral in an internal EPA memo provided to the ACLU of Michigan.

Compounding the threat is what Del Toral describes as the continued inability of officials to adequately treat water coming into people's homes from the Flint River.

"I don't want to scare people unnecessarily," said Del Toral in a phone interview from his home in Chicago. "But there is absolutely a problem in Flint that needs to be addressed right away."

During his interview with the ACLU of Michigan, Del Toral said he was willing to go on the record with his concerns, but that he was doing so as a private citizen, not as a representative of the EPA.

EPA rules, he said, required that such interviews be routed through the agency's public affairs people. But he's willing to speak out nonetheless, he said, because of the potential harm to the public is so great, and the need to address it is so urgent.

WATERING DOWN THE TESTS

Perhaps the most vexing problem in all of this is the contamination caused by the city's decades-old network of lead and iron pipes—a problem directly connected to the switch to river water, and the city's failure to adequately treat it.

Under the U.S. Environmental Protection Agency's rules, if lead reaches a level of 15 parts per billion in water, the source of the problem must be identified and corrected.

In early March, after months of requests (and only after Walters had received a doctor's note raising concerns about problems with the water), the city finally conducted a test. It found lead levels of 104 ppb the first time. A second test recorded a level of 397 ppb.

Blood tests, taken after those water-sample numbers were reported, revealed that one of her children, a four year old, had lead poisoning.

The news was devastating, said Walters, and the concern it creates for her child's future is haunting.

"Lead can affect almost every organ and system in your body," according to the EPA's web site. "Children six years old and younger are most susceptible … Even low levels of lead in the blood of children can result in: behavior and learning problems; lower IQ and hyperactivity; slowed growth; and hearing problems."

Those dangers made Walters all the more determined to get her questions answered.

For one thing, she wanted to know why residents were being instructed to "pre-flush" water lines before drawing samples that would be tested by the city

After much searching, she found Del Toral at the EPA's Region 5 in Chicago. He explained to her that her instincts were right, and that she had good cause to be concerned about the way testing was being done.

"The practice of pre-flushing before collecting compliance samples has been shown to result in the minimization of lead capture and significant underestimation of lead levels in drinking water," wrote Del Toral in an internal memo dated June 24.

Del Toral went on to say that the city's testing methods were a "serious concern" because they "could provide a false sense of security to the residents of Flint regarding lead levels in the water." As a result, he warned, residents could fail to take the necessary precautions to protect their families from lead in the drinking water.

Virginia Tech's Edwards completely agrees with Del Toral's assessment.

"The net effect of a 'pre-flush' is to greatly reduce the likelihood of detecting lead in samples collected … that would normally be present in the consumers drinking water," Edwards wrote in an email. "I have long maintained that the practice should be banned, as it artificially lowers the amount of lead detected in samples versus typical consumer exposure."

Asked about these concerns, city spokesman Jason Lorenz offered the following email reply: "While I cannot directly respond to Mr. Del Toral's remarks without first contacting the EPA Region 5 office, I can say that the City of Flint follows all the testing procedures and schedules as required by the U.S. EPA."

He added that the Michigan Department of Environmental Quality (MDEQ) endorses the city's sampling method. The MDEQ did not respond to phone calls and e-mails seeking its comments on the controversy.

Del Toral contended in an interview that what Flint's doing is actually exploiting a "loophole" in the law.

"From a technical standpoint, there's no justification for the way Flint is conducting its tests," Del Toral said. "Any credible scientist will tell you [the city's] method is not the way to catch worst-case conditions."

There is no legitimate reason for the city's methodology, said Del Toral.

EPA rules, he said, required that such interviews be routed through the agency's public affairs people. But he was willing to speak out nonetheless, he said, because of the potential harm to the public.

FLUSHING OUT REAL ANSWERS

It was Del Toral who, after determining that the lead problem plaguing the Walters family was coming from outside their home, connected LeeAnne with Edwards at Virginia Tech.

Instead of taking a single sample after a line had been "pre-flushed" under the city's direction, Edwards instructed Walters to collect a series of samples from water that had been allowed to sit in the service line long enough to accurately reflect levels the family could be exposed to under normal use.

(Meanwhile, that same service line, dug up and replaced after the sample collection, was found to be made of lead in one section and iron in another.)

Edwards tested the water and discovered that the lead contamination ranged from 200 ppb to the 13,200 ppb figure that stunned LeeAnne Walters—and should likewise shock many others.

Given the age of much of Flint's infrastructure, Edwards agrees with Del Toral's assessment that the test results they found at the Walters home amount to an alarm going off, and others in the city need to pay attention.

"I do not see any reason why there would not be serious problems occurring in at least some other Flint homes," said Edwards.

In 1986, the U.S. Safe Drinking Water Act was amended to prohibit the use of lead pipes in public water systems. Every house built before that is potentially at risk, said Edwards. About half of Flint's roughly 40,000 homes are at least 50 years old.

Making things worse is the fact that the high levels of chlorine being used to treat Flint's dirty river water lead to the creation of a carcinogenic byproduct know as total trihalomethanes, or TTHM. To keep TTHM levels down, the city is adding ferric chloride. The trouble is, that additive can also accelerate the corrosion of lead and iron pipes.

Adding yet another layer to the problem is something the city is not doing.

According to Del Toral, Flint should be adding corrosion-control chemicals designed to help keep lead and copper in pipes from leaching into drinking water. Doing so is required by federal regulations, wrote Del Toral in his memo.

"To our knowledge, that is inaccurate," said Flint spokesman Lorenz. "Before the plant was placed in operation, the City (and our engineering firm) had numerous discussions with DEQ personnel and inquired if corrosion-control chemicals – typically phosphates --needed to be included in the treatment process. The use of these chemicals was not required or mandated."

What's indisputable is this:

Flint's water contained corrosion-control chemicals until April 2014, when Flint's ties to the Detroit water system were severed. Flint officials hailed that changeover as a cost-cutting move for a city facing a financial crisis so severe it had been placed under the control of a state-appointed emergency manager.

Discontinuing the use of the anti-corrosion chemicals allowed toxic scale built up on the insides of pipes over the past decades to be released into water flowing into people's homes, explained Del Toral.

In his memo, Del Toral warned: "The lack of mitigating treatment is especially concerning as the high lead levels [that result] will likely not be reflected in the City of Flint's compliance samples due to sampling procedures used…"

In other words, at the same time the city is exacerbating the problem, it's conducting tests that will probably fail to identify the true extent of the threat.

Del Toral described the situation as a "major concern."

"In the absence of any corrosion control treatment, lead levels in drinking water can be expected to increase," he warned in his memo.

The EPA offered Flint officials the use of agency experts to help get the situation under control, said Del Toral, but added that, to his knowledge, the city has so far declined all help.

LeeAnne Walters said that when she asked why city officials weren't taking the EPA's offer of assistance, she was told, "We don't need it."

Flint spokesman Lorenz, on the other hand, maintained that "the city continues to work closely with the MDEQ and the EPA Regional Office."

As for Walters's family, that the city has finally replaced the service line leading to their home, and lead levels have dropped below the 15 ppb EPA action level.

The problem now, she said, is that water currently coming out of her tap tinged yellow and smells of rotten eggs. City officials have given her no explanation as to the possible cause of that.

It is just one more in a long list of questions that need to be addressed.

"What we need," said Walters, "are more answers."

But it's not just answers the people of Flint require.

They also need solutions. And, as Del Toral's EPA memo emphasizes, they need them immediately.

It took a while for Citizen name / Ex. 6 to realize the full impact of the number: 13,200.

Citizen name / Ex. 6 -a stay-at home mom with four sons and a husband in the Navy—had seen other numbers reflecting the quality of drinking water at her Flint home that were devastating. But 13,200? She'd never seen anything like this.

The city had tested her water twice in this past March and both times found dangerously high levels of lead—104 parts per billion (ppb) and 397 ppb, respectively.

Those numbers filled her with dread, because they meant her family had been exposed to high levels of a terribly toxic heavy metal that put her children's future in jeopardy.

But it was the result of a third test of the tap water in her home, performed by independent experts at Virginia Tech university, that most stunned Walters.

"It took a while for me to wrap my head around it," said Citizen name / Ex. 6

The VT researchers discovered lead levels in Walters' water reached a jaw-dropping 13,200 ppb—more than twice the amount at which the U.S. Environmental Protection Agency classifies water as hazardous waste.

"When I saw those numbers I was shocked," said Virginia Tech professor Marc Edwards, a former MacArthur Fellow and respected authority on corrosion in drinking-water systems, who oversaw the tests.

Edwards played a key role in discovering the problem of corroded water pipes and lead in Washington, D.C. drinking water during the early 2000s, in what has been described as one of the worst contamination events ever seen in an urban water system, with resulting increased incidence of childhood lead poisoning, miscarriages and fetal death.

In terms of lead levels, the [redacted] Citizen name / Ex. 6 family's numbers eclipsed even the worst D.C. homes.

“I have never in my 25-year career seen such outrageously high levels going into another home in the United States,” said Edwards. “This was literally hazardous-waste levels.”

But the condition of [redacted] Citizen name / Ex. 6 tap water raises a much more far-reaching question: Since the city moved away from Detroit’s water system and began pumping water from the Flint River, how many other families have been put at risk by the city’s questionable testing procedures and handling of the water supply?

The [redacted] Citizen name / Ex. 6 family surely isn’t alone in dealing with the threat of lead-laced drinking water. About half of Flint’s 40,000 homes are a half-century old or older, built at a time when water service lines were typically made of lead.

And according to various experts, including an EPA water-quality specialist, the city’s actions are only exacerbating the threat.

“What the public needs is accurate information,” explained Miguel Del Toral, regulations manager for the Ground Water and Drinking Water Branch of the EPA’s Region 5.

Instead, the city is utilizing testing measures that almost ensure that worst-case scenarios such as the one facing the Walters family escape detection, asserted Del Toral in an internal EPA memo provided to the ACLU of Michigan.

Compounding the threat is what Del Toral describes as the continued inability of officials to adequately treat water coming into people’s homes from the Flint River.

“I don’t want to scare people unnecessarily,” said Del Toral in a phone interview from his home in Chicago. “But there is absolutely a problem in Flint that needs to be addressed right away.”

During his interview with the ACLU of Michigan, Del Toral said he was willing to go on the record with his concerns, but that he was doing so as a private citizen, not as a representative of the EPA.

EPA rules, he said, required that such interviews be routed through the agency’s public affairs people. But he’s willing to speak out nonetheless, he said, because of the potential harm to the public is so great, and the need to address it is so urgent.

WATERING DOWN THE TESTS

Perhaps the most vexing problem in all of this is the contamination caused by the city’s decades-old network of lead and iron pipes—a problem directly connected to the switch to river water, and the city’s failure to adequately treat it.

Under the U.S. Environmental Protection Agency’s rules, if lead reaches a level of 15 parts per billion in water, the source of the problem must be identified and corrected.

In early March, after months of requests (and only after [redacted] had received a doctor’s note raising concerns about problems with the water), the city finally conducted a test. It found lead levels of 104 ppb the first time. A second test recorded a level of 397 ppb.

Blood tests, taken after those water-sample numbers were reported, revealed that one of her children, a four year old, had lead poisoning.

The news was devastating, said Walters, and the concern it creates for her child’s future is haunting.

“Lead can affect almost every organ and system in your body,” according to the EPA’s web site. “Children six years old and younger are most susceptible … Even low levels of lead in the blood of children can result in: behavior and learning problems; lower IQ and hyperactivity; slowed growth; and hearing problems.”

Those dangers made Citizen name / Ex. 6 all the more determined to get her questions answered.

For one thing, she wanted to know why residents were being instructed to “pre-flush” water lines before drawing samples that would be tested by the city

After much searching, she found Del Toral at the EPA’s Region 5 in Chicago. He explained to her that her instincts were right, and that she had good cause to be concerned about the way testing was being done.

“The practice of pre-flushing before collecting compliance samples has been shown to result in the minimization of lead capture and significant underestimation of lead levels in drinking water,” wrote Del Toral in an internal memo dated June 24.

Del Toral went on to say that the city’s testing methods were a “serious concern” because they “could provide a false sense of security to the residents of Flint regarding lead levels in the water.” As a result, he warned, residents could fail to take the necessary precautions to protect their families from lead in the drinking water.

Virginia Tech’s Edwards completely agrees with Del Toral’s assessment.

“The net effect of a ‘pre-flush’ is to greatly reduce the likelihood of detecting lead in samples collected … that would normally be present in the consumers drinking water,” Edwards wrote in an email. “I have long maintained that the practice should be banned, as it artificially lowers the amount of lead detected in samples versus typical consumer exposure.”

Asked about these concerns, city spokesman Jason Lorenz offered the following email reply: “While I cannot directly respond to Mr. Del Toral's remarks without first contacting the EPA Region 5 office, I can say that the City of Flint follows all the testing procedures and schedules as required by the U.S. EPA."

He added that the Michigan Department of Environmental Quality (MDEQ) endorses the city's sampling method. The MDEQ did not respond to phone calls and e-mails seeking its comments on the controversy.

Del Toral contended in an interview that what Flint's doing is actually exploiting a "loophole" in the law.

"From a technical standpoint, there's no justification for the way Flint is conducting its tests," Del Toral said. "Any credible scientist will tell you [the city's] method is not the way to catch worst-case conditions."

There is no legitimate reason for the city's methodology, said Del Toral.

EPA rules, he said, required that such interviews be routed through the agency's public affairs people. But he was willing to speak out nonetheless, he said, because of the potential harm to the public.

FLUSHING OUT REAL ANSWERS

It was Del Toral who, after determining that the lead problem plaguing the Citizen name / Ex. 6 family was coming from outside their home, connected Citizen name / Ex. 6 th Edwards at Virginia Tech.

Instead of taking a single sample after a line had been "pre-flushed" under the city's direction, Edwards instructed Walters to collect a series of samples from water that had been allowed to sit in the service line long enough to accurately reflect levels the family could be exposed to under normal use.

(Meanwhile, that same service line, dug up and replaced after the sample collection, was found to be made of lead in one section and iron in another.)

Edwards tested the water and discovered that the lead contamination ranged from 200 ppb to the 13,200 ppb figure that stunned Citizen name / Ex. 6 —and should likewise shock many others.

Given the age of much of Flint's infrastructure, Edwards agrees with Del Toral's assessment that the test results they found at the Walters home amount to an alarm going off, and others in the city need to pay attention.

"I do not see any reason why there would not be serious problems occurring in at least some other Flint homes," said Edwards.

In 1986, the U.S. Safe Drinking Water Act was amended to prohibit the use of lead pipes in public water systems. Every house built before that is potentially at risk, said Edwards. About half of Flint's roughly 40,000 homes are at least 50 years old.

Making things worse is the fact that the high levels of chlorine being used to treat Flint's dirty river water lead to the creation of a carcinogenic byproduct know as total trihalomethanes, or TTHM. To keep TTHM levels down, the city is adding ferric chloride. The trouble is, that additive can also accelerate the corrosion of lead and iron pipes.

Adding yet another layer to the problem is something the city is not doing.

According to Del Toral, Flint should be adding corrosion-control chemicals designed to help keep lead and copper in pipes from leaching into drinking water. Doing so is required by federal regulations, wrote Del Toral in his memo.

"To our knowledge, that is inaccurate," said Flint spokesman Lorenz. "Before the plant was placed in operation, the City (and our engineering firm) had numerous discussions with DEQ personnel and inquired if corrosion-control chemicals – typically phosphates --needed to be included in the treatment process. The use of these chemicals was not required or mandated."

What's indisputable is this:

Flint's water contained corrosion-control chemicals until April 2014, when Flint's ties to the Detroit water system were severed. Flint officials hailed that changeover as a cost-cutting move for a city facing a financial crisis so severe it had been placed under the control of a state-appointed emergency manager.

Discontinuing the use of the anti-corrosion chemicals allowed toxic scale built up on the insides of pipes over the past decades to be released into water flowing into people's homes, explained Del Toral.

In his memo, Del Toral warned: "The lack of mitigating treatment is especially concerning as the high lead levels [that result] will likely not be reflected in the City of Flint's compliance samples due to sampling procedures used…"

In other words, at the same time the city is exacerbating the problem, it's conducting tests that will probably fail to identify the true extent of the threat.

Del Toral described the situation as a "major concern."

"In the absence of any corrosion control treatment, lead levels in drinking water can be expected to increase," he warned in his memo.

The EPA offered Flint officials the use of agency experts to help get the situation under control, said Del Toral, but added that, to his knowledge, the city has so far declined all help.

Citizen name / Ex. 6 said that when she asked why city officials weren't taking the EPA's offer of assistance, she was told, "We don't need it."

Flint spokesman Lorenz, on the other hand, maintained that “the city continues to work closely with the MDEQ and the EPA Regional Office.”

As for Walters’s family, that the city has finally replaced the service line leading to their home, and lead levels have dropped below the 15 ppb EPA action level.

The problem now, she said, is that water currently coming out of her tap tinged yellow and smells of rotten eggs. City officials have given her no explanation as to the possible cause of that.

It is just one more in a long list of questions that need to be addressed.

“What we need,” said Citizen name / Ex. 6 “are more answers.”

But it’s not just answers the people of Flint require.

They also need solutions. And, as Del Toral’s EPA memo emphasizes, they need them immediately.

Summary of Inaccurate statements and mischaracterizations

It took a while for LeeAnne Walters to realize the full impact of the number: 13,200. Walters—a stay-at home mom with four sons and a husband in the Navy—had seen other numbers reflecting the quality of drinking water at her Flint home that were devastating. But 13,200? She'd never seen anything like this.

The ACLU should revise the article to include more specifics on the high results so as not to unduly alarm the residents of Flint. The very high lead levels discovered in the samples were from the Walters' residence after the water had been stagnant in the service line for almost a month (April 3, 2015 to April 27, 2015). The Walters' service line configuration and long length is also likely not what would be found in most typical homes in Flint. Using the information in an unexplained or unqualified manner can lead to residents inferring that their situations could be the same.

The Walters family surely isn't alone in dealing with the threat of lead-laced drinking water. About half of Flint's 40,000 homes are a half-century old or older, built at a time when water service lines were typically made of lead.

Although there certainly are lead lines in Flint, EPA does not have information to indicate when lead service lines were used or not used in Flint. Unless the period of time that lead lines were used is known to the ACLU, it should not be assumed that lead lines were used during this time. Many cities stopped using lead lines in the 1920s, 1930s, 1940s, etc.

Del Toral contended in an interview that what Flint's doing is actually exploiting a "loophole" in the law.

"From a technical standpoint, there's no justification for the way Flint is conducting its tests," Del Toral said. "Any credible scientist will tell you [the city's] method is not the way to catch worst-case conditions."

There is no legitimate reason for the city's methodology, said Del Toral.

The Lead and Copper Rule is silent on the issue of pre-flushing before collecting compliance samples. It does not include pre-flushing instructions or prohibit them. EPA is concerned with the potential impact of pre-flushing, given the absence of treatment for lead and we are in discussions with the MDEQ on this issue.

EPA rules, he said, required that such interviews be routed through the agency's public affairs people. But he was willing to speak out nonetheless, he said, because of the potential harm to the public.

Do we want to address this? If so, I am not sure what we would say.

Instead of taking a single sample after a line had been "pre-flushed" under the city's direction, Edwards instructed Walters to collect a series of samples from water that had been allowed to sit in the service line long enough to accurately reflect levels the family could be exposed to under normal use.

This characterization is not accurate/misleading. Prior to the collection of the samples, the water was not used in the home from April 3, 2015 to April 27, 2015. This is not how water is used in a typical home. The ACLU should explain how the conditions under which the samples were collected and the atypical (very long) service line at the Walters' residence, to put these results in the proper context.

Given the age of much of Flint's infrastructure, Edwards agrees with Del Toral's assessment that the test results they found at the Walters home amount to an alarm going off, and others in the city need to pay attention.

This is a mischaracterization of what I said. I did not say this about the VT sampling. I said this about the samples collected by the City of Flint from the Walters' home (104 ppb & 397 ppb). It was with respect to the lack of any mitigating treatment, and my professional opinion regarding the disintegration of the existing scales formed during the time phosphate treated water was provided by Detroit, which would be occurring city-wide.

According to Del Toral, Flint should be adding corrosion-control chemicals designed to help keep lead and copper in pipes from leaching into drinking water. Doing so is required by federal regulations, wrote Del Toral in his memo.

This is not an accurate statement. What I said was that large systems were required to install and maintain optimal corrosion control, unless the system meets the treatment exemption criteria in the Lead and Copper Rule.

The EPA offered Flint officials the use of agency experts to help get the situation under control, said Del Toral, but added that, to his knowledge, the city has so far declined all help.

This is not accurate. EPA has discuss the offer to technical assistance to the City of Flint.

LeeAnne Walters said that when she asked why city officials weren't taking the EPA's offer of assistance, she was told, "We don't need it."

--**[End of summary]**--

Introductory comment: I quit work early one day and [redacted] *called that day after I had quit work and asked if I would speak to the ACLU. I told* [redacted] *that I had no authority to speak to the ACLU on behalf of EPA and that he should contact our public affairs office if he wanted comments from EPA.* [redacted] *indicated that he just wanted to better understand some of the issues and I reiterated that although I was willing to speak to him in my personal capacity, I wanted it to be very clear that I am not speaking on behalf of EPA and that any questions I answer are not to portrayed as EPA comments or responses. I also reiterated the same to the ACLU when Mr. Guyette called later that day. The language in the article seems to convey that I was the one that initiated the contact with the ACLU out of concern with the situation in Flint. I did not contact the ACLU, offer to contact the ACLU or have any intent to do so in my EPA or personal capacity regarding Flint or any other drinking water issue. I do contact the ACLU for other non-work issues and discussed those with* [redacted] *Unlike bankers and tax lawyers sifting through tax law to avoid tax liabilities, I want to comply with the letter and the spirit of the ethics regulations and I am willing to work with EPA to clarify the training regarding outside activities so that others don't have to go through this. I will be* [redacted]

The central issue I focused on in my discussion with the ACLU was the need for Flint to evaluate treatment on a system-wide basis, and the EPA offer to provide technical assistance so that they are not fixing one problem (E.coli and Coliform MCL violations) only to cause another problem (TTHM MCL violations).

It took a while for LeeAnne Walters to realize the full impact of the number: 13,200.

MDT comment: I tried to make it clear that using these results could unduly alarm the public. I stressed is that we do not want to unduly alarm the residents in Flint, and I said this more than once regarding the very high lead at the Citizen name / Ex. 6 home. I said we had never seen lead levels this high in drinking water and we had no information that would tell us if the Citizen name / Ex. 6 home was unique or whether there were any other homes with similar configurations. I also said that these results were from sampling conducted after the water in that service line had not been used for almost a month, so it is very likely not representative of what we would expect to find in most homes in Flint unless the Citizen name / Ex. 6 service line configuration is more common than we think, which is doubtful. Mr. Guyette chose to use the highest result from that sampling set and without proper qualification.

Walters—a stay-at home mom with four sons and a husband in the Navy—had seen other numbers reflecting the quality of drinking water at her Flint home that were devastating. But 13,200? She'd never seen anything like this.

The city had tested her water twice in this past March and both times found dangerously high levels of lead—104 parts per billion (ppb) and 397 ppb, respectively.

Those numbers filled her with dread, because they meant her family had been exposed to high levels of a terribly toxic heavy metal that put her children's future in jeopardy.

But it was the result of a third test of the tap water in her home, performed by independent experts at Virginia Tech university, that most stunned Walters.

"It took a while for me to wrap my head around it," said Walters.

The VT researchers discovered lead levels in Walters' water reached a jaw-dropping 13,200 ppb—more than twice the amount at which the U.S. Environmental Protection Agency classifies water as hazardous waste.

"When I saw those numbers I was shocked," said Virginia Tech professor Marc Edwards, a former MacArthur Fellow and respected authority on corrosion in drinking-water systems, who oversaw the tests.

Edwards played a key role in discovering the problem of corroded water pipes and lead in Washington, D.C. drinking water during the early 2000s, in what has been described as one of the *worst* contamination events ever seen in an urban water system, with resulting increased incidence of childhood lead poisoning, miscarriages and fetal death.

In terms of lead levels, the Walters family's numbers eclipsed even the worst D.C. homes.

"I have never in my 25-year career seen such outrageously high levels going into another home in the United States," said Edwards. "This was literally hazardous-waste levels."

But the condition of Walters' tap water raises a much more far-reaching question: Since the city moved away from Detroit's water system and began pumping water from the Flint River, how many other families have been put at risk by the city's questionable testing procedures and handling of the water supply?

The Walters family surely isn't alone in dealing with the threat of lead-laced drinking water. About half of Flint's 40,000 homes are a half-century old or older, built at a time when water service lines were typically made of lead.

MDT: This did not come from me. Flint definitely used lead lines, but I have no idea whatsoever when they stopped using lead lines in Flint.

And according to various experts, including an EPA water-quality specialist, the city's actions are only exacerbating the threat.

"What the public needs is accurate information," explained Miguel Del Toral, regulations manager for the Ground Water and Drinking Water Branch of the EPA's Region 5.

MDT: This was part of my trying to stress that we should not unduly alarm people.

Instead, the city is utilizing testing measures that almost ensure that worst-case scenarios such as the one facing the Walters family escape detection, asserted Del Toral in an internal EPA memo provided to the ACLU of Michigan.

Compounding the threat is what Del Toral describes as the continued inability of officials to adequately treat water coming into people's homes from the Flint River.

MDT: The main focus of what I told the ACLU was that Flint has gone from essentially a finishing operation at the treatment plant to a raw water treatment plant and is dealing with a number of drinking water issues and could benefit from expert assistance in simultaneously complying across all drinking water regulations.

"I don't want to scare people unnecessarily," said Del Toral in a phone interview from his home in Chicago. "But there is absolutely a problem in Flint that needs to be addressed right away."

MDT: My comment was specifically on lead. In the absence of treatment we expect that lead levels will increase due to the presence of lead service lines. The concerns that the Region has and the actions to be taken are scheduled for discussion with MDEQ later in July.

During his interview with the ACLU of Michigan, Del Toral said he was willing to go on the record with his concerns, but that he was doing so as a private citizen, not as a representative of the EPA.

EPA rules, he said, required that such interviews be routed through the agency's public affairs people. But he's willing to speak out nonetheless, he said, because of the potential harm to the public is so great, and the need to address it is so urgent.

MDT: What I said was that I was not authorized to speak on behalf of EPA and that if he wanted EPA's comments he should contact public affairs.

WATERING DOWN THE TESTS

Perhaps the most vexing problem in all of this is the contamination caused by the city's decades-old network of lead and iron pipes—a problem directly connected to the switch to river water, and the city's failure to adequately treat it.

Under the U.S. Environmental Protection Agency's rules, if lead reaches a level of 15 parts per billion in water, the source of the problem must be identified and corrected.

In early March, after months of requests (and only after Walters had received a doctor's note raising concerns about problems with the water), the city finally conducted a test. It found lead levels of 104 ppb the first time. A second test recorded a level of 397 ppb.

Blood tests, taken after those water-sample numbers were reported, revealed that one of her children, a four year old, had lead poisoning.

The news was devastating, said Walters, and the concern it creates for her child's future is haunting.

"Lead can affect almost every organ and system in your body," according to the EPA's web site. "Children six years old and younger are most susceptible … Even low levels of lead in the blood of children can result in: behavior and learning problems; lower IQ and hyperactivity; slowed growth; and hearing problems."

Those dangers made Walters all the more determined to get her questions answered.

For one thing, she wanted to know why residents were being instructed to "pre-flush" water lines before drawing samples that would be tested by the city

After much searching, she found Del Toral at the EPA's Region 5 in Chicago. He explained to her that her instincts were right, and that she had good cause to be concerned about the way testing was being done.

"The practice of pre-flushing before collecting compliance samples has been shown to result in the minimization of lead capture and significant underestimation of lead levels in drinking water," wrote Del Toral in an internal memo dated June 24.

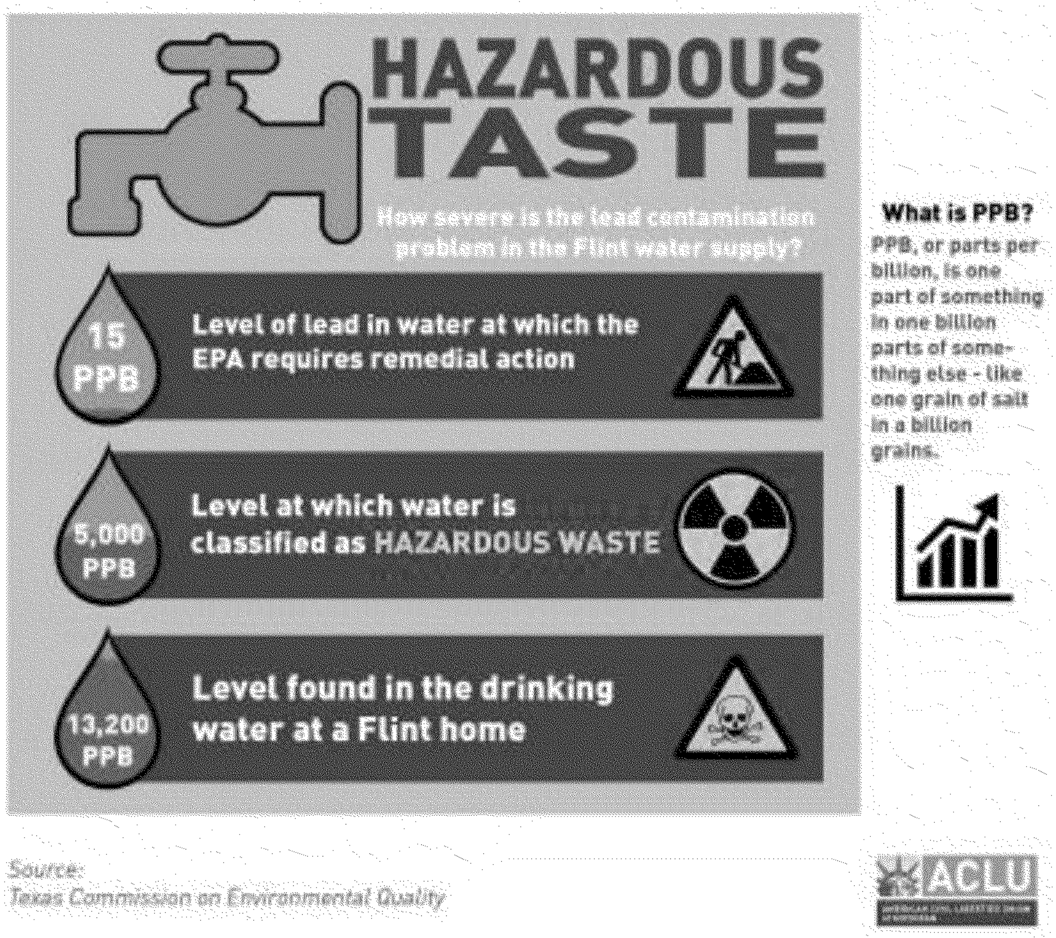
Del Toral went on to say that the city's testing methods were a "serious concern" because they "could provide a false sense of security to the residents of Flint regarding lead levels in the water." As a result, he warned, residents could fail to take the necessary precautions to protect their families from lead in the drinking water.

Virginia Tech's Edwards completely agrees with Del Toral's assessment.

"The net effect of a 'pre-flush' is to greatly reduce the likelihood of detecting lead in samples collected … that would normally be present in the consumers drinking water," Edwards wrote in an email. "I have long maintained that the practice should be banned, as it artificially lowers the amount of lead detected in samples versus typical consumer exposure."

Asked about these concerns, city spokesman Jason Lorenz offered the following email reply: "While I cannot directly respond to Mr. Del Toral's remarks without first contacting the EPA Region 5 office, I can say that the City of Flint follows all the testing procedures and schedules as required by the U.S. EPA."

He added that the Michigan Department of Environmental Quality (MDEQ) endorses the city's sampling method. The MDEQ did not respond to phone calls and e-mails seeking its comments on the controversy.



HAZARDOUS TASTE
How severe is the lead contamination problem in the Flint water supply?
15 PPB
Level of lead in water at which the EPA requires remedial action
5,000 PPB
Level at which water is classified as HAZARDOUS WASTE
13,200 PPB
Level found in the drinking water at a Flint home
What is PPB?
ACLU

PPB, or parts per billion, is one part of something in one billion parts of something else - like one grain of salt in a billion grains.

Source:
Texas Commission on Environmental Quality

Del Toral contended in an interview that what Flint's doing is actually exploiting a "loophole" in the law.

MDT: Unfortunately, I can't recall exactly what I said on this. Flint, as well as all other systems in Michigan are following the MDEQ guidance which includes the pre-flushing.

"From a technical standpoint, there's no justification for the way Flint is conducting its tests," Del Toral said. "Any credible scientist will tell you [the city's] method is not the way to catch worst-case conditions."

There is no legitimate reason for the city's methodology, said Del Toral.

MDT: Again, this is ACLU wording. I think I said something like there was no technical reason for pre-flushing (i.e., it is not something that is done in response to a problem with the EPA sampling method).

EPA rules, he said, required that such interviews be routed through the agency's public affairs people. But he was willing to speak out nonetheless, he said, because of the potential harm to the public.

MDT: See above comment on this issue.

FLUSHING OUT REAL ANSWERS

It was Del Toral who, after determining that the lead problem plaguing the Walters family was coming from outside their home, connected LeeAnne with Edwards at Virginia Tech.

Instead of taking a single sample after a line had been "pre-flushed" under the city's direction, Edwards instructed Walters to collect a series of samples from water that had been allowed to sit in the service line long enough to accurately reflect levels the family could be exposed to under normal use.

MDT: This is not accurate. The water sat in the pipes from April 3, 2015 through April 27, 2015, which is not typical of average household usage.

(Meanwhile, that same service line, dug up and replaced after the sample collection, was found to be made of lead in one section and iron in another.)

Edwards tested the water and discovered that the lead contamination ranged from 200 ppb to the 13,200 ppb figure that stunned LeeAnne Walters—and should likewise shock many others.

Given the age of much of Flint's infrastructure, Edwards agrees with Del Toral's assessment that the test results they found at the Walters home amount to an alarm going off, and others in the city need to pay attention.

MDT: This is a mischaracterization of what I said. I did not say this about the VT sampling. I said this about the samples collected by the City of Flint from the Walters' home (104 ppb & 397 ppb). It was with respect to the lack of any mitigating treatment, and my professional opinion regarding the disintegration of the existing scales formed during the time phosphate

treated water was provided by Detroit, which would be occurring city-wide.

"I do not see any reason why there would not be serious problems occurring in at least some other Flint homes," said Edwards.

In 1986, the U.S. Safe Drinking Water Act was amended to prohibit the use of lead pipes in public water systems. Every house built before that is potentially at risk, said Edwards. About half of Flint's roughly 40,000 homes are at least 50 years old.

Making things worse is the fact that the high levels of chlorine being used to treat Flint's dirty river water lead to the creation of a carcinogenic byproduct know as total trihalomethanes, or TTHM. To keep TTHM levels down, the city is adding ferric chloride. The trouble is, that additive can also accelerate the corrosion of lead and iron pipes.

Adding yet another layer to the problem is something the city is *not* doing.

According to Del Toral, Flint should be adding corrosion-control chemicals designed to help keep lead and copper in pipes from leaching into drinking water. Doing so is required by federal regulations, wrote Del Toral in his memo.

MDT: This is not an accurate statement. What I said was that large systems were required to install and maintain optimal corrosion control, unless the system meets the treatment exemption criteria in the Lead and Copper Rule.

"To our knowledge, that is inaccurate," said Flint spokesman Lorenz. "Before the plant was placed in operation, the City (and our engineering firm) had numerous discussions with DEQ personnel and inquired if corrosion-control chemicals – typically phosphates --needed to be included in the treatment process. The use of these chemicals was not required or mandated."

What's indisputable is this:

Flint's water contained corrosion-control chemicals until April 2014, when Flint's ties to the Detroit water system were severed. Flint officials hailed that changeover as a cost-cutting move for a city facing a financial crisis so severe it had been placed under the control of a state-appointed emergency manager.

Discontinuing the use of the anti-corrosion chemicals allowed toxic scale built up on the insides of pipes over the past decades to be released into water flowing into people's homes, explained Del Toral.

In his memo, Del Toral warned: "The lack of mitigating treatment is especially concerning as the high lead levels [that result] will likely not be reflected in the City of Flint's compliance samples due to sampling procedures used…"

In other words, at the same time the city is exacerbating the problem, it's conducting tests that will probably fail to identify the true extent of the threat.

Del Toral described the situation as a “major concern.”

“In the absence of any corrosion control treatment, lead levels in drinking water can be expected to increase,” he warned in his memo.

The EPA offered Flint officials the use of agency experts to help get the situation under control, said Del Toral, but added that, to his knowledge, the city has so far declined all help.

MDT: This is inaccurate. My standing recommendation to R5 management is to pursue this and that has not played out yet. He may be mixing up what I said with what Ms. Walters said (see below).

LeeAnne Walters said that when she asked why city officials weren’t taking the EPA’s offer of assistance, she was told, “We don’t need it.”

Flint spokesman Lorenz, on the other hand, maintained that “the city continues to work closely with the MDEQ and the EPA Regional Office.”

As for Walters’s family, that the city has finally replaced the service line leading to their home, and lead levels have dropped below the 15 ppb EPA action level.

The problem now, she said, is that water currently coming out of her tap tinged yellow and smells of rotten eggs. City officials have given her no explanation as to the possible cause of that.

It is just one more in a long list of questions that need to be addressed.

“What we need,” said Walters, “are more answers.”

But it’s not just answers the people of Flint require.

They also need solutions. And, as Del Toral’s EPA memo emphasizes, they need them immediately.

Corrosive Impact: Leaded Water and One Flint Family's Toxic Nightmare

Jul 09 Posted by Curt Guyette in Democracy Watch

It took a while for Citizen name / Ex. 6 [redacted] realize the full impact of the number: 13,200.

Citizen name / Ex. 6 [redacted]—a stay-at home mom with four sons and a husband in the Navy—had seen other numbers reflecting the quality of drinking water at her Flint home that were devastating. But 13,200? She'd never seen anything like this.

The city had tested her water twice in this past March and both times found dangerously high levels of lead—104 parts per billion (ppb) and 397 ppb, respectively.

Those numbers filled her with dread, because they meant her family had been exposed to high levels of a terribly toxic heavy metal that put her children's future in jeopardy.

But it was the result of a third test of the tap water in her home, performed by independent experts at Virginia Tech university, that most stunned Walters.

"It took a while for me to wrap my head around it," said Citizen name / Ex. 6 [redacted]

The VT researchers discovered lead levels in Walters' water reached a jaw-dropping 13,200 ppb—more than twice the amount at which the U.S. Environmental Protection Agency classifies water as hazardous waste.

"When I saw those numbers I was shocked," said Virginia Tech professor Marc Edwards, a former MacArthur Fellow and respected authority on corrosion in drinking-water systems, who oversaw the tests.

Edwards played a key role in discovering the problem of corroded water pipes and lead in Washington, D.C. drinking water during the early 2000s, in what has been described as one of the worst contamination events ever seen in an urban water system, with resulting increased incidence of childhood lead poisoning, miscarriages and fetal death.

In terms of lead levels, the Citizen name / Ex. 6 [redacted] family's numbers eclipsed even the worst D.C. homes.

"I have never in my 25-year career seen such outrageously high levels going into another home in the United States," said Edwards. "This was literally hazardous-waste levels."

But the condition of Citizen name / Ex. 6 [redacted] tap water raises a much more far-reaching question:

Since the city moved away from Detroit's water system and began pumping water from the Flint River, how many other families have been put at risk by the city's questionable testing procedures and handling of the water supply?

The Citizen name / Ex. 6 family surely isn't alone in dealing with the threat of lead-laced drinking water. About half of Flint's 40,000 homes are a half-century old or older, built at a time when water service lines were typically made of lead.

And according to various experts, including an EPA water-quality specialist, the city's actions are only exacerbating the threat.

"What the public needs is accurate information," explained Miguel Del Toral, regulations manager for the Ground Water and Drinking Water Branch of the EPA's Region 5.

Instead, the city is utilizing testing measures that almost ensure that worst-case scenarios such as the one facing the Walters family escape detection, asserted Del Toral in an internal EPA memo provided to the ACLU of Michigan.

Compounding the threat is what Del Toral describes as the continued inability of officials to adequately treat water coming into people's homes from the Flint River.

"I don't want to scare people unnecessarily," said Del Toral in a phone interview from his home in Chicago. "But there is absolutely a problem in Flint that needs to be addressed right away."

During his interview with the ACLU of Michigan, Del Toral said he was willing to go on the record with his concerns, but that he was doing so as a private citizen, not as a representative of the EPA.

EPA rules, he said, required that such interviews be routed through the agency's public affairs people. But he's willing to speak out nonetheless, he said, because of the potential harm to the public is so great, and the need to address it is so urgent.

WATERING DOWN THE TESTS

Perhaps the most vexing problem in all of this is the contamination caused by the city's decades-old network of lead and iron pipes—a problem directly connected to the switch to river water, and the city's failure to adequately treat it.

Under the U.S. Environmental Protection Agency's rules, if lead reaches a level of 15 parts per billion in water, the source of the problem must be identified and corrected.

In early March, after months of requests (and only after Citizen name / Ex. 6 had received a doctor's note raising concerns about problems with the water), the city finally conducted a test. It found lead levels of 104 ppb the first time. A second test recorded a level of 397 ppb.

Blood tests, taken after those water-sample numbers were reported, revealed that one of her children, a four year old, had lead poisoning.

The news was devastating, said Citizen name / Ex. 6 and the concern it creates for her child's future is haunting.

"Lead can affect almost every organ and system in your body," according to the EPA's web site. "Children six years old and younger are most susceptible … Even low levels of lead in the blood of children can result in: behavior and learning problems; lower IQ and hyperactivity; slowed growth; and hearing problems."

Those dangers made Citizen name / Ex. 6 all the more determined to get her questions answered.

For one thing, she wanted to know why residents were being instructed to "pre-flush" water lines before drawing samples that would be tested by the city

After much searching, she found Del Toral at the EPA's Region 5 in Chicago. He explained to her that her instincts were right, and that she had good cause to be concerned about the way testing was being done.

"The practice of pre-flushing before collecting compliance samples has been shown to result in the minimization of lead capture and significant underestimation of lead levels in drinking water," wrote Del Toral in an internal memo dated June 24.

Del Toral went on to say that the city's testing methods were a "serious concern" because they "could provide a false sense of security to the residents of Flint regarding lead levels in the water." As a result, he warned, residents could fail to take the necessary precautions to protect their families from lead in the drinking water.

Virginia Tech's Edwards completely agrees with Del Toral's assessment.

"The net effect of a 'pre-flush' is to greatly reduce the likelihood of detecting lead in samples collected … that would normally be present in the consumers drinking water," Edwards wrote in an email. "I have long maintained that the practice should be banned, as it artificially lowers the amount of lead detected in samples versus typical consumer exposure."

Asked about these concerns, city spokesman Jason Lorenz offered the following email reply: "While I cannot directly respond to Mr. Del Toral's remarks without first contacting the EPA Region 5 office, I can say that the City of Flint follows all the testing procedures and schedules as required by the U.S. EPA."

He added that the Michigan Department of Environmental Quality (MDEQ) endorses the city's sampling method. The MDEQ did not respond to phone calls and e-mails seeking its comments on the controversy.

Del Toral contended in an interview that what Flint's doing is actually exploiting a "loophole" in the law.

"From a technical standpoint, there's no justification for the way Flint is conducting its tests," Del Toral said. "Any credible scientist will tell you [the city's] method is not the way to catch worst-case conditions."

There is no legitimate reason for the city's methodology, said Del Toral.

EPA rules, he said, required that such interviews be routed through the agency's public affairs people. But he was willing to speak out nonetheless, he said, because of the potential harm to the public.

FLUSHING OUT REAL ANSWERS

It was Del Toral who, after determining that the lead problem plaguing the Citizen name / Ex. 6 family was coming from outside their home, connected Citizen name / Ex. 6 with Edwards at Virginia Tech.

Instead of taking a single sample after a line had been "pre-flushed" under the city's direction, Edwards instructed Citizen name / Ex. 6 o collect a series of samples from water that had been allowed to sit in the service line long enough to accurately reflect levels the family could be exposed to under normal use.

(Meanwhile, that same service line, dug up and replaced after the sample collection, was found to be made of lead in one section and iron in another.)

Edwards tested the water and discovered that the lead contamination ranged from 200 ppb to the 13,200 ppb figure that stunned Citizen name / Ex. 6 —and should likewise shock many others.

Given the age of much of Flint's infrastructure, Edwards agrees with Del Toral's assessment that the test results they found at the Walters home amount to an alarm going off, and others in the city need to pay attention.

"I do not see any reason why there would not be serious problems occurring in at least some other Flint homes," said Edwards.

In 1986, the U.S. Safe Drinking Water Act was amended to prohibit the use of lead pipes in public water systems. Every house built before that is potentially at risk, said Edwards. About half of Flint's roughly 40,000 homes are at least 50 years old.

Making things worse is the fact that the high levels of chlorine being used to treat Flint's dirty river water lead to the creation of a carcinogenic byproduct know as total trihalomethanes, or TTHM. To keep TTHM levels down, the city is adding ferric chloride. The trouble is, that additive can also accelerate the corrosion of lead and iron pipes.

Adding yet another layer to the problem is something the city is not doing.

According to Del Toral, Flint should be adding corrosion-control chemicals designed to help keep lead and copper in pipes from leaching into drinking water. Doing so is required by federal regulations, wrote Del Toral in his memo.

"To our knowledge, that is inaccurate," said Flint spokesman Lorenz. "Before the plant was placed in operation, the City (and our engineering firm) had numerous discussions with DEQ personnel and inquired if corrosion-control chemicals – typically phosphates --needed to be included in the treatment process. The use of these chemicals was not required or mandated."

What's indisputable is this:

Flint's water contained corrosion-control chemicals until April 2014, when Flint's ties to the Detroit water system were severed. Flint officials hailed that changeover as a cost-cutting move for a city facing a financial crisis so severe it had been placed under the control of a state-appointed emergency manager.

Discontinuing the use of the anti-corrosion chemicals allowed toxic scale built up on the insides of pipes over the past decades to be released into water flowing into people's homes, explained Del Toral.

In his memo, Del Toral warned: "The lack of mitigating treatment is especially concerning as the high lead levels [that result] will likely not be reflected in the City of Flint's compliance samples due to sampling procedures used…"

In other words, at the same time the city is exacerbating the problem, it's conducting tests that will probably fail to identify the true extent of the threat.

Del Toral described the situation as a "major concern."

"In the absence of any corrosion control treatment, lead levels in drinking water can be expected to increase," he warned in his memo.

The EPA offered Flint officials the use of agency experts to help get the situation under control, said Del Toral, but added that, to his knowledge, the city has so far declined all help.

Citizen name / Ex. 6 said that when she asked why city officials weren't taking the EPA's offer of assistance, she was told, "We don't need it."

Flint spokesman Lorenz, on the other hand, maintained that "the city continues to work closely with the MDEQ and the EPA Regional Office."

As for Walters's family, that the city has finally replaced the service line leading to their home, and lead levels have dropped below the 15 ppb EPA action level.

The problem now, she said, is that water currently coming out of her tap tinged yellow and smells of rotten eggs. City officials have given her no explanation as to the possible cause of that.

It is just one more in a long list of questions that need to be addressed.

"What we need," said Citizen name / Ex. 6 "are more answers."

But it's not just answers the people of Flint require.

They also need solutions. And, as Del Toral's EPA memo emphasizes, they need them immediately.

MDT comments on ACLU article version 2 07-10-2015.docx

Tinka –

In response to Susan's request, attached is a document in two parts. The first part is a summary list of inaccurate statements in the article, each followed by an explanation or correction to the statement. The second is the article itself, annotated with Miguel's comments. I am sending to you so you have the chance to review it before it goes to Susan.

Miguel said to give him a call on Monday morning if you have any questions regarding the content and he can provide explanation, additional information, etc.

Corrosive Impact: Leaded Water and One Flint Family's Toxic Nightmare

Jul 09 Posted by Curt Guyette in Democracy Watch

It took a while for LeeAnne Walters to realize the full impact of the number: 13,200.

Walters—a stay-at home mom with four sons and a husband in the Navy—had seen other numbers reflecting the quality of drinking water at her Flint home that were devastating. But 13,200? She'd never seen anything like this.

The city had tested her water twice in this past March and both times found dangerously high levels of lead—104 parts per billion (ppb) and 397 ppb, respectively.

Those numbers filled her with dread, because they meant her family had been exposed to high levels of a terribly toxic heavy metal that put her children's future in jeopardy.

But it was the result of a third test of the tap water in her home, performed by independent experts at Virginia Tech university, that most stunned Walters.

"It took a while for me to wrap my head around it," said Walters.

The VT researchers discovered lead levels in Walters' water reached a jaw-dropping 13,200 ppb—more than twice the amount at which the U.S. Environmental Protection Agency classifies water as hazardous waste.

"When I saw those numbers I was shocked," said Virginia Tech professor Marc Edwards, a former MacArthur Fellow and respected authority on corrosion in drinking-water systems, who oversaw the tests.

Edwards played a key role in discovering the problem of corroded water pipes and lead in Washington, D.C. drinking water during the early 2000s, in what has been described as one of the worst contamination events ever seen in an urban water system, with resulting increased incidence of childhood lead poisoning, miscarriages and fetal death.

In terms of lead levels, the Walters family's numbers eclipsed even the worst D.C. homes.

"I have never in my 25-year career seen such outrageously high levels going into another home in the United States," said Edwards. "This was literally hazardous-waste levels."

But the condition of Walters' tap water raises a much more far-reaching question: Since the city moved away from Detroit's water system and began pumping water from the Flint River, how many other families have been put at risk by the city's questionable testing procedures and handling of the water supply?

The Walters family surely isn't alone in dealing with the threat of lead-laced drinking water. About half of Flint's 40,000 homes are a half-century old or older, built at a time when water service lines were typically made of lead.

And according to various experts, including an EPA water-quality specialist, the city's actions are only exacerbating the threat.

“What the public needs is accurate information,” explained Miguel Del Toral, regulations manager for the Ground Water and Drinking Water Branch of the EPA’s Region 5.

Instead, the city is utilizing testing measures that almost ensure that worst-case scenarios such as the one facing the Walters family escape detection, asserted Del Toral in an internal EPA memo provided to the ACLU of Michigan.

Compounding the threat is what Del Toral describes as the continued inability of officials to adequately treat water coming into people’s homes from the Flint River.

“I don’t want to scare people unnecessarily,” said Del Toral in a phone interview from his home in Chicago. “But there is absolutely a problem in Flint that needs to be addressed right away.”

During his interview with the ACLU of Michigan, Del Toral said he was willing to go on the record with his concerns, but that he was doing so as a private citizen, not as a representative of the EPA.

EPA rules, he said, required that such interviews be routed through the agency’s public affairs people. But he’s willing to speak out nonetheless, he said, because of the potential harm to the public is so great, and the need to address it is so urgent.

WATERING DOWN THE TESTS

Perhaps the most vexing problem in all of this is the contamination caused by the city’s decades-old network of lead and iron pipes—a problem directly connected to the switch to river water, and the city’s failure to adequately treat it.

Under the U.S. Environmental Protection Agency's rules, if lead reaches a level of 15 parts per billion in water, the source of the problem must be identified and corrected.

In early March, after months of requests (and only after Walters had received a doctor's note raising concerns about problems with the water), the city finally conducted a test. It found lead levels of 104 ppb the first time. A second test recorded a level of 397 ppb.

Blood tests, taken after those water-sample numbers were reported, revealed that one of her children, a four year old, had lead poisoning.

The news was devastating, said Walters, and the concern it creates for her child's future is haunting.

"Lead can affect almost every organ and system in your body," according to the EPA's web site. "Children six years old and younger are most susceptible … Even low levels of lead in the blood of children can result in: behavior and learning problems; lower IQ and hyperactivity; slowed growth; and hearing problems."

Those dangers made Walters all the more determined to get her questions answered.

For one thing, she wanted to know why residents were being instructed to "pre-flush" water lines before drawing samples that would be tested by the city

After much searching, she found Del Toral at the EPA's Region 5 in Chicago. He explained to her that her instincts were right, and that she had good cause to be concerned about the way testing was being done.

“The practice of pre-flushing before collecting compliance samples has been shown to result in the minimization of lead capture and significant underestimation of lead levels in drinking water,” wrote Del Toral in an internal memo dated June 24.

Del Toral went on to say that the city’s testing methods were a “serious concern” because they “could provide a false sense of security to the residents of Flint regarding lead levels in the water.” As a result, he warned, residents could fail to take the necessary precautions to protect their families from lead in the drinking water.

Virginia Tech’s Edwards completely agrees with Del Toral’s assessment.

“The net effect of a ‘pre-flush’ is to greatly reduce the likelihood of detecting lead in samples collected … that would normally be present in the consumers drinking water,” Edwards wrote in an email. “I have long maintained that the practice should be banned, as it artificially lowers the amount of lead detected in samples versus typical consumer exposure.”

Asked about these concerns, city spokesman Jason Lorenz offered the following email reply: “While I cannot directly respond to Mr. Del Toral's remarks without first contacting the EPA Region 5 office, I can say that the City of Flint follows all the testing procedures and schedules as required by the U.S. EPA.”

He added that the Michigan Department of Environmental Quality (MDEQ) endorses the city’s sampling method. The MDEQ did not respond to phone calls and e-mails seeking its comments on the controversy.

Del Toral contended in an interview that what Flint’s doing is actually exploiting a “loophole” in the law.

“From a technical standpoint, there’s no justification for the way Flint is conducting its tests,” Del Toral said. “Any credible scientist will tell you [the city’s] method is not the way to catch worst-case conditions.”

There is no legitimate reason for the city's methodology, said Del Toral.

EPA rules, he said, required that such interviews be routed through the agency's public affairs people. But he was willing to speak out nonetheless, he said, because of the potential harm to the public.

FLUSHING OUT REAL ANSWERS

It was Del Toral who, after determining that the lead problem plaguing the Walters family was coming from outside their home, connected LeeAnne with Edwards at Virginia Tech.

Instead of taking a single sample after a line had been "pre-flushed" under the city's direction, Edwards instructed Walters to collect a series of samples from water that had been allowed to sit in the service line long enough to accurately reflect levels the family could be exposed to under normal use.

(Meanwhile, that same service line, dug up and replaced after the sample collection, was found to be made of lead in one section and iron in another.)

Edwards tested the water and discovered that the lead contamination ranged from 200 ppb to the 13,200 ppb figure that stunned LeeAnne Walters—and should likewise shock many others.

Given the age of much of Flint's infrastructure, Edwards agrees with Del Toral's assessment that the test results they found at the Walters home amount to an alarm going off, and others in the city need to pay attention.

“I do not see any reason why there would not be serious problems occurring in at least some other Flint homes,” said Edwards.

In 1986, the U.S. Safe Drinking Water Act was amended to prohibit the use of lead pipes in public water systems. Every house built before that is potentially at risk, said Edwards. About half of Flint’s roughly 40,000 homes are at least 50 years old.

Making things worse is the fact that the high levels of chlorine being used to treat Flint’s dirty river water lead to the creation of a carcinogenic byproduct know as total trihalomethanes, or TTHM. To keep TTHM levels down, the city is adding ferric chloride. The trouble is, that additive can also accelerate the corrosion of lead and iron pipes.

Adding yet another layer to the problem is something the city is not doing.

According to Del Toral, Flint should be adding corrosion-control chemicals designed to help keep lead and copper in pipes from leaching into drinking water. Doing so is required by federal regulations, wrote Del Toral in his memo.

“To our knowledge, that is inaccurate,” said Flint spokesman Lorenz. “Before the plant was placed in operation, the City (and our engineering firm) had numerous discussions with DEQ personnel and inquired if corrosion-control chemicals – typically phosphates --needed to be included in the treatment process. The use of these chemicals was not required or mandated.”

What’s indisputable is this:

Flint’s water contained corrosion-control chemicals until April 2014, when Flint’s ties to the Detroit water system were severed. Flint officials hailed that changeover as a cost-cutting move for a city facing a financial crisis so severe it had been placed under the control of a state-appointed emergency manager.

Discontinuing the use of the anti-corrosion chemicals allowed toxic scale built up on the insides of pipes over the past decades to be released into water flowing into people's homes, explained Del Toral.

In his memo, Del Toral warned: "The lack of mitigating treatment is especially concerning as the high lead levels [that result] will likely not be reflected in the City of Flint's compliance samples due to sampling procedures used…"

In other words, at the same time the city is exacerbating the problem, it's conducting tests that will probably fail to identify the true extent of the threat.

Del Toral described the situation as a "major concern."

"In the absence of any corrosion control treatment, lead levels in drinking water can be expected to increase," he warned in his memo.

The EPA offered Flint officials the use of agency experts to help get the situation under control, said Del Toral, but added that, to his knowledge, the city has so far declined all help.

LeeAnne Walters said that when she asked why city officials weren't taking the EPA's offer of assistance, she was told, "We don't need it."

Flint spokesman Lorenz, on the other hand, maintained that "the city continues to work closely with the MDEQ and the EPA Regional Office."

As for Walters's family, that the city has finally replaced the service line leading to their home, and lead levels have dropped below the 15 ppb EPA action level.

The problem now, she said, is that water currently coming out of her tap tinged yellow and smells of rotten eggs. City officials have given her no explanation as to the possible cause of that.

It is just one more in a long list of questions that need to be addressed.

"What we need," said Walters, "are more answers."

But it's not just answers the people of Flint require.

They also need solutions. And, as Del Toral's EPA memo emphasizes, they need them immediately.

It took a while for LeeAnne Walters to realize the full impact of the number: 13,200.

Walters—a stay-at home mom with four sons and a husband in the Navy—had seen other numbers reflecting the quality of drinking water at her Flint home that were devastating. But 13,200? She'd never seen anything like this.

The city had tested her water twice in this past March and both times found dangerously high levels of lead—104 parts per billion (ppb) and 397 ppb, respectively.

Those numbers filled her with dread, because they meant her family had been exposed to high levels of a terribly toxic heavy metal that put her children's future in jeopardy.

But it was the result of a third test of the tap water in her home, performed by independent experts at Virginia Tech university, that most stunned Walters.

"It took a while for me to wrap my head around it," said Walters.

The VT researchers discovered lead levels in Walters' water reached a jaw-dropping 13,200 ppb—more than twice the amount at which the U.S. Environmental Protection Agency classifies water as hazardous waste.

"When I saw those numbers I was shocked," said Virginia Tech professor Marc Edwards, a former MacArthur Fellow and respected authority on corrosion in drinking-water systems, who oversaw the tests.

Edwards played a key role in discovering the problem of corroded water pipes and lead in Washington, D.C. drinking water during the early 2000s, in what has been described as one of the worst contamination events ever seen in an urban water system, with resulting increased incidence of childhood lead poisoning, miscarriages and fetal death.

In terms of lead levels, the Walters family's numbers eclipsed even the worst D.C. homes.

"I have never in my 25-year career seen such outrageously high levels going into another home in the United States," said Edwards. "This was literally hazardous-waste levels."

But the condition of Walters' tap water raises a much more far-reaching question: Since the city moved away from Detroit's water system and began pumping water from the Flint River, how many other families have been put at risk by the city's questionable testing procedures and handling of the water supply?

The Walters family surely isn't alone in dealing with the threat of lead-laced drinking water. About half of Flint's 40,000 homes are a half-century old or older, built at a time when water service lines were typically made of lead.

And according to various experts, including an EPA water-quality specialist, the city's actions are only exacerbating the threat.

"What the public needs is accurate information," explained Miguel Del Toral, regulations manager for the Ground Water and Drinking Water Branch of the EPA's Region 5.

Instead, the city is utilizing testing measures that almost ensure that worst-case scenarios such as the one facing the Walters family escape detection, asserted Del Toral in an internal EPA memo provided to the ACLU of Michigan.

Compounding the threat is what Del Toral describes as the continued inability of officials to adequately treat water coming into people's homes from the Flint River.

"I don't want to scare people unnecessarily," said Del Toral in a phone interview from his home in Chicago. "But there is absolutely a problem in Flint that needs to be addressed right away."

During his interview with the ACLU of Michigan, Del Toral said he was willing to go on the record with his concerns, but that he was doing so as a private citizen, not as a representative of the EPA.

EPA rules, he said, required that such interviews be routed through the agency's public affairs people. But he's willing to speak out nonetheless, he said, because of the potential harm to the public is so great, and the need to address it is so urgent.

WATERING DOWN THE TESTS

Perhaps the most vexing problem in all of this is the contamination caused by the city's decades-old network of lead and iron pipes—a problem directly connected to the switch to river water, and the city's failure to adequately treat it.

Under the U.S. Environmental Protection Agency's rules, if lead reaches a level of 15 parts per billion in water, the source of the problem must be identified and corrected.

In early March, after months of requests (and only after Walters had received a doctor's note raising concerns about problems with the water), the city finally conducted a test. It found lead levels of 104 ppb the first time. A second test recorded a level of 397 ppb.

Blood tests, taken after those water-sample numbers were reported, revealed that one of her children, a four year old, had lead poisoning.

The news was devastating, said Walters, and the concern it creates for her child's future is haunting.

"Lead can affect almost every organ and system in your body," according to the EPA's web site. "Children six years old and younger are most susceptible … Even low levels of lead in the blood of children can result in: behavior and learning problems; lower IQ and hyperactivity; slowed growth; and hearing problems."

Those dangers made Walters all the more determined to get her questions answered.

For one thing, she wanted to know why residents were being instructed to "pre-flush" water lines before drawing samples that would be tested by the city

After much searching, she found Del Toral at the EPA's Region 5 in Chicago. He explained to her that her instincts were right, and that she had good cause to be concerned about the way testing was being done.

"The practice of pre-flushing before collecting compliance samples has been shown to result in the minimization of lead capture and significant underestimation of lead levels in drinking water," wrote Del Toral in an internal memo dated June 24.

Del Toral went on to say that the city's testing methods were a "serious concern" because they "could provide a false sense of security to the residents of Flint regarding lead levels in the water." As a result, he warned, residents could fail to take the necessary precautions to protect their families from lead in the drinking water.

Virginia Tech's Edwards completely agrees with Del Toral's assessment.

"The net effect of a 'pre-flush' is to greatly reduce the likelihood of detecting lead in samples collected … that would normally be present in the consumers drinking water," Edwards wrote in an email. "I have long maintained that the practice should be banned, as it artificially lowers the amount of lead detected in samples versus typical consumer exposure."

Asked about these concerns, city spokesman Jason Lorenz offered the following email reply: "While I cannot directly respond to Mr. Del Toral's remarks without first contacting the EPA Region 5 office, I can say that the City of Flint follows all the testing procedures and schedules as required by the U.S. EPA."

He added that the Michigan Department of Environmental Quality (MDEQ) endorses the city's sampling method. The MDEQ did not respond to phone calls and e-mails seeking its comments on the controversy.

Del Toral contended in an interview that what Flint's doing is actually exploiting a "loophole" in the law.

“From a technical standpoint, there’s no justification for the way Flint is conducting its tests,” Del Toral said. “Any credible scientist will tell you [the city’s] method is not the way to catch worst-case conditions.”

There is no legitimate reason for the city’s methodology, said Del Toral.

EPA rules, he said, required that such interviews be routed through the agency’s public affairs people. But he was willing to speak out nonetheless, he said, because of the potential harm to the public.

FLUSHING OUT REAL ANSWERS

It was Del Toral who, after determining that the lead problem plaguing the Walters family was coming from outside their home, connected LeeAnne with Edwards at Virginia Tech.

Instead of taking a single sample after a line had been “pre-flushed” under the city’s direction, Edwards instructed Walters to collect a series of samples from water that had been allowed to sit in the service line long enough to accurately reflect levels the family could be exposed to under normal use.

(Meanwhile, that same service line, dug up and replaced after the sample collection, was found to be made of lead in one section and iron in another.)

Edwards tested the water and discovered that the lead contamination ranged from 200 ppb to the 13,200 ppb figure that stunned LeeAnne Walters—and should likewise shock many others.

Given the age of much of Flint’s infrastructure, Edwards agrees with Del Toral’s assessment that the test results they found at the Walters home amount to an alarm going off, and others in the city need to pay attention.

“I do not see any reason why there would not be serious problems occurring in at least some other Flint homes,” said Edwards.

In 1986, the U.S. Safe Drinking Water Act was amended to prohibit the use of lead pipes in public water systems. Every house built before that is potentially at risk, said Edwards. About half of Flint’s roughly 40,000 homes are at least 50 years old.

Making things worse is the fact that the high levels of chlorine being used to treat Flint’s dirty river water lead to the creation of a carcinogenic byproduct know as total trihalomethanes, or TTHM. To keep TTHM levels down, the city is adding ferric chloride. The trouble is, that additive can also accelerate the corrosion of lead and iron pipes.

Adding yet another layer to the problem is something the city is not doing.

According to Del Toral, Flint should be adding corrosion-control chemicals designed to help keep lead and copper in pipes from leaching into drinking water. Doing so is required by federal regulations, wrote Del Toral in his memo.

“To our knowledge, that is inaccurate,” said Flint spokesman Lorenz. “Before the plant was placed in operation, the City (and our engineering firm) had numerous discussions with DEQ personnel and inquired if corrosion-control chemicals – typically phosphates --needed to be included in the treatment process. The use of these chemicals was not required or mandated.”

What’s indisputable is this:

Flint’s water contained corrosion-control chemicals until April 2014, when Flint’s ties to the Detroit water system were severed. Flint officials hailed that changeover as a cost-cutting move for a city facing a financial crisis so severe it had been placed under the control of a state-appointed emergency manager.

Discontinuing the use of the anti-corrosion chemicals allowed toxic scale built up on the insides of pipes over the past decades to be released into water flowing into people’s homes, explained Del Toral.

In his memo, Del Toral warned: “The lack of mitigating treatment is especially concerning as the high lead levels [that result] will likely not be reflected in the City of Flint’s compliance samples due to sampling procedures used…”

In other words, at the same time the city is exacerbating the problem, it’s conducting tests that will probably fail to identify the true extent of the threat.

Del Toral described the situation as a “major concern.”

“In the absence of any corrosion control treatment, lead levels in drinking water can be expected to increase,” he warned in his memo.

The EPA offered Flint officials the use of agency experts to help get the situation under control, said Del Toral, but added that, to his knowledge, the city has so far declined all help.

LeeAnne Walters said that when she asked why city officials weren’t taking the EPA’s offer of assistance, she was told, “We don’t need it.”

Flint spokesman Lorenz, on the other hand, maintained that “the city continues to work closely with the MDEQ and the EPA Regional Office.”

As for Walters’s family, that the city has finally replaced the service line leading to their home, and lead levels have dropped below the 15 ppb EPA action level.

The problem now, she said, is that water currently coming out of her tap tinged yellow and smells of rotten eggs. City officials have given her no explanation as to the possible cause of that.

It is just one more in a long list of questions that need to be addressed.

“What we need,” said Walters, “are more answers.”

But it’s not just answers the people of Flint require.

They also need solutions. And, as Del Toral’s EPA memo emphasizes, they need them immediately.

Subject: Fw: Flint Water Question from a Pregnant Flint Resident

Hi Tinka,

Tom, Rita, Nick and Tim are out, so I wanted to run this by you before responding...

We received an email from a resident in Flint which was also sent to Dr Edwards at Virginia Tech. Below is the email exchange between Dr. Edwards and the resident. I propose to respond to the resident with the draft email below, but wanted to run this by you before I send it. Please advise.

Kim - Please send the draft response on TTHMs to Tinka for review before sending and copy Jen, since she is acting today.

DRAFT RESPONSE

Hello **Citizen name / Ex. 6**

I agree with Marc's responses on the water filter . Filters that are certified to remove lead are typically designed to remove 99 percent of lead. They are also designed with additional capacity as a safety measure, but you should still change the filter in accordance with the manufacturer's instructions.

Regarding the sampling, it can get fairly expensive to collect water samples to characterize lead levels in the untreated and treated water and I don't think that is necessary. If you change the filter in accordance with the manufacturer's instructions, you should be fine. If your concern is regarding the capacity of the filter to remove the lead, you could collect a sample of the filtered water which I think would be more informative and less expensive than trying to characterize the untreated and treated water. If you decide to test the water, you should use a laboratory that has been certified by the State for drinking water analyses (link below).

http://www.michigan.gov/deq/0,4561,7-135-3307_4131_4156-36940--,00.html

Regarding your questions on the TTHMs, I am not a health effects expert, so I am forwarding your email to Kimberly Harris for response.

Regards,

Miguel Del Toral

Hi Kim,

See email exchange below. I think Marc's responses are fine on the lead, but we need to respond to the TTHM/showering questions, which I think you have responded in the past. Please forward your draft response to Tinka for review prior to responding.

Subject: RE: Flint Water Question from a Pregnant Flint Resident

I think it will ok. Just replace the filter in the device on the recommended schedule, and do not drink the water if it is discolored…the water should look clean.

Best Regards, Marc

Subject: Re: Flint Water Question from a Pregnant Flint Resident

Marc, thank you for your quick reply and thoughtful feedback. I appreciate it very much. You are correct that the faucet filter is rated to remove 99% of lead contamination. What I am not certain about is whether that level of removal is variable based on the amount of lead coming to the faucet. I suppose that if a higher lead level would just result in the filter needing replacement sooner rather than passing more through the filter and into my drinking glass. Please correct me if this is a mistaken assumption.

Again, thank you, and Miguel I appreciate any recommendations you may have as well.

All the best,

Mona

On Sat, Jul 11, 2015 at 8:31 PM, Marc Edwards <edwardsm@vt.edu> wrote:

Hi Citizen name / Ex. 6

I too thank Miguel for his leadership on this.

I think the filtered water will generally be of very high quality. It is likely that your filtered is rated for lead removal....let me know.

Even if it is not rated for lead, it is probably a big improvement and does remove a lot of the lead, if it is present.

Bottled water is a good alternative, but as you say, there is no “perfectly” pure water source.

If it were me, I would continue to use the filtered water. Good luck with your pregnancy. Sounds like you are doing everything right.

Best Regards,

Marc

Subject: Flint Water Question from a Pregnant Flint Resident

Dear Dr. Edwards and Dr. Del Toral,

Thank you for the work you have already done in my city to protect families from water contaminant exposure. I am a Flint resident, pregnant with my first child, and therefore advised to drink a whopping 10-16 cups of water each day. I am writing to see if you can shed some light or point me to another source for answers regarding water testing and the safest option for staying hydrated.

If your wife or sister or friend were living in Flint and pregnant, what course of action would you recommend she take? Here is my situation:

- A little background: Prior to becoming pregnant, I installed a pur advanced water filter on our kitchen faucet and always use it when drinking from the tap, which I do frequently. (According to the pur website, the filter is said to filter out 70+ chemicals. Recently, I contacted the company to request more information on exactly what chemicals are filtered and up to what level, and am awaiting their reply.) When using the filter, the water is crystal clear, free of the river smell and without the slight yellow tinge that we sometimes have coming out of the tap (unlike in our bathroom sink which I use to brush my teeth...). I was compelled to purchase the filter because my legs began to swell after Flint changed to the river water, and after installing the filter this problem went away. I even tested the difference by drinking filtered water some days (consistently no swelling) and and unfiltered water others (consistent swelling) for a week or two. I understand the swelling to be the result of sodium chloride in our water which is corrosive enough to make GM stop using Flint water in their local plant

(http://www.mlive.com/news/flint/index.ssf/2014/10/general_motors_wont_use_flint.html)

- Given your findings of high levels of lead in some residents' water, my husband strongly believes that I should cease drinking all Flint water and drink bottled water instead. However, I have read extensively about safety concerns of plastic-bottled water (chemists who work with plastics avoid drinking it) and this does not seem to be a safer option despite frequent bottled water drives organized by well-meaning activists across Flint.

- I would like to test our house's tap water with and without the kitchen filter using an independent lab, but my husband thinks this will be a futile effort because we have no reliable way of knowing if the results on one day will be consistent with results on other days, such as if the City of Flint were doing some special change to the water treatment procedure. Would testing multiple times across several weeks be sufficient to address this possibility? If so, how many times and at what interval would you recommend testing, and can you recommend a testing lab? If a high level of lead is discovered, who should we contact to determine where the lead is coming from as a next step?

- According to the consultant that Erin Brockovich sent to Flint earlier this year (http://www.mlive.com/news/flint/index.ssf/2015/02/tthm_how_worried_should_flint.html), total trihalomethanes (TTHM) in the water are dangerous to pregnant women through inhalation exposure during hot showers. (And pregnant women tend to appreciate long, hot showers because our backs are constantly aching!) At this point, the lead issues seem more frightening, though we are considering investing in a costly whole-house water filtration system to deal with both. How can we determine the relative risk to pregnant women for lead in the water vs. TTHMs? I suppose that could differ from house to house. What sort of whole-house filtration would you recommend?

- Are there any other considerations that you think I should keep in mind?

Even for those residents who are privileged to be educated and able to afford water filtration devices, the public water issues we are living with are confounding. The information we receive about our public water supply tends to be fragmented and coming from local public officials who have an interest in downplaying public concerns. In the meantime, it is very difficult to make truly informed decisions about our health.

Thank you in advance for any insights you can share and helping to give my baby a good start in life. I understand if you need to respond as a fellow resident of the world and as experts in general rather than as affiliates of the organizations in which you are employed.

Thank you much,

Subject: RE: Flint Water Question from a Pregnant Flint Resident

Miguel – Thanks for sharing your draft response. I recommend the following:

1. That we send one response that covers both the TTHMs and the Lead questions. Once you have Kim's response then please combine them into one message.

2. I think that she wants to test her water because she only has one filtered tap (the kitchen) and her bath tap is not filtered. She also had a couple other questions which I'm not sure we can answer. To make sure we provide a complete response, I have a couple of questions:

- □□□□□□□□ Will the city test her unfiltered water? If so we can refer her to them.
- □□□□□□□□ Do we have a recommended testing frequency?
- □□□□□□□□ If there are high levels of lead how to they assess the source?

If we are only responding to the question of how to get water tested, I recommend rewording the second paragraph as follows:

~~Regarding the sampling, it can get fairly expensive to collect water samples to characterize lead levels in the untreated and treated water and I don't think that is necessary. If you change the filter in accordance with the manufacturer's instructions, you should be fine. If your concern is regarding the capacity of the filter to remove the lead, you could collect a sample of the filtered water which I think would be more informative and less expensive than trying to characterize the untreated and treated water.~~ If you decide to test your filtered and unfiltered water, you should use a laboratory that has been certified by the State for drinking water analyses (link below).

http://www.michigan.gov/deq/0,4561,7-135-3307_4131_4156-36940--,00.html

Once you have answered my questions above and Kim has developed a response, please send me your updated response. Thanks.

Subject: Fw: Flint Water Question from a Pregnant Flint Resident

Hi Tinka,

Tom, Rita, Nick and Tim are out, so I wanted to run this by you before responding...

We received an email from a resident in Flint which was also sent to Dr Edwards at Virginia Tech. Below is the email exchange between Dr. Edwards and the resident. I propose to respond to the resident with the draft email below, but wanted to run this by you before I send it. Please advise.

Kim - Please send the draft response on TTHMs to Tinka for review before sending and copy Jen, since she is acting today.

DRAFT RESPONSE

Citizen name / Ex. 6

I agree with Marc's responses on the water filter . Filters that are certified to remove lead are typically designed to remove 99 percent of lead. They are also designed with additional capacity as a safety measure, but you should still change the filter in accordance with the manufacturer's instructions.

Regarding the sampling, it can get fairly expensive to collect water samples to characterize lead levels in the untreated and treated water and I don't think that is necessary. If you change the filter in accordance with the manufacturer's instructions, you should be fine. If your concern is regarding the capacity of the filter to remove the lead, you could collect a sample of the filtered water which I think would be more informative and less expensive than trying to characterize the untreated and treated water. If you decide to test the water, you should use a laboratory that has been certified by the State for drinking water analyses (link below).

http://www.michigan.gov/deq/0,4561,7-135-3307_4131_4156-36940--,00.html

Regarding your questions on the TTHMs, I am not a health effects expert, so I am forwarding your email to Kimberly Harris for response.

Regards,

Miguel Del Toral

Hi Kim,

See email exchange below. I think Marc's responses are fine on the lead, but we need to respond to the TTHM/showering questions, which I think you have responded in the past. Please forward your draft response to Tinka for review prior to responding.

Subject: Re: Flint Water Question from a Pregnant Flint Resident

Marc, thank you for your quick reply and thoughtful feedback. I appreciate it very much. You are correct that the faucet filter is rated to remove 99% of lead contamination. What I am not certain about is whether that level of removal is variable based on the amount of lead coming to the faucet. I suppose that if a higher lead level would just result in the filter needing replacement sooner rather than passing more through the filter and into my drinking glass. Please correct me if this is a mistaken assumption.

Again, thank you, and Miguel I appreciate any recommendations you may have as well.

All the best,

Subject: Re: Flint Water Question from a Pregnant Flint Resident

Sounds good. I'll wait on Kim and combine everyone into one response. On your questions below...

Will the city test her unfiltered water? If so we can refer her to them.

Yes, the city will test her water, but they do resident-requested testing using pre-flushed 1st draw samples and I cannot in good conscience recommend that. It would miss any lead that is there if she has a lead service line and she would have a false sense of security and may end up being exposed to high lead levels.

Do we have a recommended testing frequency?

The sample collection methodology is far more important than the testing frequency. For example, if frequent (monthly) pre-flushed first-draw samples were collected, you would miss the high lead every time you sample. You would catch lead particles from time to time becasuse they are released sporadically, but that is hit or miss in any given sample. If you collect a set of sequential samples only once, that would provide much better information because it tells you if there is high lead and where it is coming from, but a typical set of sequential samples would involved 12-15 samples at about $25 per sample ($300 - $375), and that's not something the average homeowner can afford. I didn't want to get into all of these details with the resident for obvious resasons. Regarding the bathroom tap...I don't recommend filters for the bathroom tap, so I should have also included a recommendation that if she tests the filtered water from the kitchen tap and it's fine, maybe another recommendation is that only water from the kitchen tap should be used for consumption (cooking/drinking).

•□□□□□□□□ If there are high levels of lead how to they assess the source?

The most straightforward way is to collect sequential samples, but as I mentioned that can be expensive, and if you find a lead line, my recommendation would be to use a water filter anyway. Since she is already doing that, I tried to provide advice based on her specific situation.

1. That we send one response that covers both the TTHMs and the Lead questions. Once you have Kim's response then please combine them into one message.

2. I think that she wants to test her water because she only has one filtered tap (the kitchen) and her bath tap is not filtered. She also had a couple other questions which I'm not sure we can answer. To make sure we provide a complete response, I have a couple of questions:

- Will the city test her unfiltered water? If so we can refer her to them.
- Do we have a recommended testing frequency?
- If there are high levels of lead how to they assess the source?

If we are only responding to the question of how to get water tested, I recommend rewording the second paragraph as follows:

~~Regarding the sampling, it can get fairly expensive to collect water samples to characterize lead levels in the untreated and treated water and I don't think that is necessary. If you change the filter in accordance with the manufacturer's instructions, you should be fine. If your concern is regarding the capacity of the filter to remove the lead, you could collect a sample of the filtered water which I think would be more informative and less expensive than trying to characterize the untreated and treated water.~~ If you decide to test your filtered and unfiltered water, you should use a laboratory that has been certified by the State for drinking water analyses (link below).

http://www.michigan.gov/deq/0,4561,7-135-3307_4131_4156-36940--,00.html

Once you have answered my questions above and Kim has developed a response, please send me your updated response. Thanks.

Subject: Fw: Flint Water Question from a Pregnant Flint Resident

Hi Tinka,

Tom, Rita, Nick and Tim are out, so I wanted to run this by you before responding...

We received an email from a resident in Flint which was also sent to Dr Edwards at Virginia Tech. Below is the email exchange between Dr. Edwards and the resident. I propose to respond to the resident with the draft email below, but wanted to run this by you before I send it. Please advise.

Kim - Please send the draft response on TTHMs to Tinka for review before sending and copy Jen, since she is acting today.

DRAFT RESPONSE

Hello Citizen name / Ex. 6

I agree with Marc's responses on the water filter . Filters that are certified to remove lead are typically designed to remove 99 percent of lead. They are also designed with additional capacity as a safety measure, but you should still change the filter in accordance with the manufacturer's instructions.

Regarding the sampling, it can get fairly expensive to collect water samples to characterize lead levels in the untreated and treated water and I don't think that is necessary. If you change the filter in accordance with the manufacturer's instructions, you should be fine. If your concern is regarding the capacity of the filter to remove the lead, you could collect a sample of the filtered water which I think would be more informative and less expensive than trying to characterize the untreated and treated water. If you decide to test the water, you should use a laboratory that has been certified by the State for drinking water analyses (link

below).

http://www.michigan.gov/deq/0,4561,7-135-3307_4131_4156-36940--,00.html

Regarding your questions on the TTHMs, I am not a health effects expert, so I am forwarding your email to Kimberly Harris for response.

Regards,

Miguel Del Toral

Hi Kim,

See email exchange below. I think Marc's responses are fine on the lead, but we need to respond to the TTHM/showering questions, which I think you have responded in the past. Please forward your draft response to Tinka for review prior to responding.

I think it will ok. Just replace the filter in the device on the recommended schedule, and do not drink the water if it is discolored…the water should look clean.

Best Regards, Marc

Subject: Re: Flint Water Question from a Pregnant Flint Resident

Marc, thank you for your quick reply and thoughtful feedback. I appreciate it very much. You are correct that the faucet filter is rated to remove 99% of lead contamination. What I am not certain about is whether that level of removal is variable based on the amount of lead coming to the faucet. I suppose that if a higher lead level would just result in the filter needing replacement sooner rather than passing more through the filter and into my drinking glass. Please correct me if this is a mistaken assumption.

Again, thank you, and Miguel I appreciate any recommendations you may have as well.

All the best,

Citizen name / Ex. 6

On Sat, Jul 11, 2015 at 8:31 PM, Marc Edwards <edwardsm@vt.edu> wrote:

Hi Citizen name / Ex. 6

I too thank Miguel for his leadership on this.

I think the filtered water will generally be of very high quality. It is likely that your filtered is rated for lead removal….let me know.

Even if it is not rated for lead, it is probably a big improvement and does remove a lot of the lead, if it is present.

Bottled water is a good alternative, but as you say, there is no "perfectly" pure water source.

If it were me, I would continue to use the filtered water. Good luck with your pregnancy. Sounds like you are doing everything right.

Best Regards,

Marc

Subject: Flint Water Question from a Pregnant Flint Resident

Dear Dr. Edwards and Dr. Del Toral,

Thank you for the work you have already done in my city to protect families from water contaminant exposure. I am a Flint resident, pregnant with my first child, and therefore advised to drink a whopping 10-16 cups of water each day. I am writing to see if you can shed some light or point me to another source for answers regarding water testing and the safest option for staying hydrated.

If your wife or sister or friend were living in Flint and pregnant, what course of action would you recommend she take? Here is my situation:

- A little background: Prior to becoming pregnant, I installed a pur advanced water filter on our kitchen faucet and always use it when drinking from the tap, which I do frequently. (According to the pur website, the filter is said to filter out 70+ chemicals. Recently, I contacted the company to request more information on exactly what chemicals are filtered and up to what level, and am awaiting their reply.) When using the filter, the water is crystal clear, free of the river smell and without the slight yellow tinge that we sometimes have coming out of the tap (unlike in our bathroom sink which I use to brush my teeth...). I was compelled to purchase the filter because my legs began to swell after Flint changed to the river water, and after installing the filter this problem went away. I even tested the difference by drinking filtered water some days (consistently no swelling) and and unfiltered water others (consistent swelling) for a week or two. I understand the swelling to be the result of sodium chloride in our water which is corrosive enough to make GM stop using Flint water in their local plant (http://www.mlive.com/news/flint/index.ssf/2014/10/general_motors_wont_use_flint.html)

- Given your findings of high levels of lead in some residents' water, my husband strongly believes that I should cease drinking all Flint water and drink bottled water instead. However, I have read extensively about safety concerns of plastic-bottled water (chemists who work with plastics avoid drinking it) and this does not seem to be a safer option despite frequent bottled water drives organized by well-meaning activists across Flint.

- I would like to test our house's tap water with and without the kitchen filter using an independent lab, but my husband thinks this will be a futile effort because we have no reliable way of knowing if the results on one day will be consistent with results on other days, such as if the City of Flint were doing some special change to the water treatment procedure. Would testing multiple times across several weeks be sufficient to address this possibility? If so, how many times and at what interval would you recommend testing, and can you recommend a testing lab? If a high level of lead is discovered, who should we contact to determine where the lead is coming from as a next step?

- According to the consultant that Erin Brockovich sent to Flint earlier this year (http://www.mlive.com/news/flint/index.ssf/2015/02/tthm_how_worried_should_flint.html), total trihalomethanes (TTHM) in the water are dangerous to pregnant women through inhalation exposure during hot showers. (And pregnant women tend to appreciate long, hot showers because our backs are constantly aching!) At this point, the lead issues seem more frightening, though we are considering investing in a costly whole-house water filtration system to deal with both. How can we determine the relative risk to pregnant women for lead in the water vs. TTHMs? I suppose that could differ from house to house. What sort of whole-house filtration would you recommend?

- Are there any other considerations that you think I should keep in mind?

Even for those residents who are privileged to be educated and able to afford water filtration devices, the public water issues we are living with are confounding. The information we receive about our public water supply tends to be fragmented and coming from local public officials who have an interest in downplaying public concerns. In the meantime, it is very difficult to make truly informed decisions about our health.

Thank you in advance for any insights you can share and helping to give my baby a good start in life. I understand if you need to respond as a fellow resident of the world and as experts in general rather than as affiliates of the organizations in which you are employed.

Thank you much,

Sounds good. I'll wait on Kim and combine everyone into one response. On your questions below...

Will the city test her unfiltered water? If so we can refer her to them.

Yes, the city will test her water, but they do resident-requested testing using pre-flushed 1st draw samples and I cannot in good conscience recommend that. It would miss any lead that is there if she has a lead service line and she would have a false sense of security and may end up being exposed to high lead levels.

Do we have a recommended testing frequency?

The sample collection methodology is far more important than the testing frequency. For example, if frequent (monthly) pre-flushed first-draw samples were collected, you would miss the high lead every time you sample. You would catch lead particles from time to time becasuse they are released sporadically, but that is hit or miss in any given sample. If you collect a set of sequential samples only once, that would provide much better information because it tells you if there is high lead and where it is coming from, but a typical set of sequential samples would involved 12-15 samples at about $25 per sample ($300 - $375), and that's not something the average homeowner can afford. I didn't want to get into all of these details with the resident for obvious resasons. Regarding the bathroom tap...I don't recommend filters for the bathroom tap, so I should have also included a recommendation that if she tests the filtered water from the kitchen tap and it's fine, maybe another recommendation is that only water from the kitchen tap should be used for consumption (cooking/drinking).

- **If there are high levels of lead how to they assess the source?**

The most straightforward way is to collect sequential samples, but as I mentioned that can be expensive, and if you find a lead line, my recommendation would be to use a water filter anyway. Since she is already doing that, I tried to provide advice based on her specific situation.

Marc, thank you for your quick reply and thoughtful feedback. I appreciate it very much. You are correct that the faucet filter is rated to remove 99% of lead contamination. What I am not certain about is whether that level of removal is variable based on the amount of lead coming to the faucet. I suppose that if a higher lead level would just result in the filter needing replacement sooner rather than passing more through the filter and into my drinking glass. Please correct me if this is a mistaken assumption.

Again, thank you, and Miguel I appreciate any recommendations you may have as well.

All the best,

Citizen name / Ex. 6

On Sat, Jul 11, 2015 at 8:31 PM, Marc Edwards <edwardsm@vt.edu> wrote:

Hi Citizen name / Ex. 6

I too thank Miguel for his leadership on this.

I think the filtered water will generally be of very high quality. It is likely that your filtered is rated for lead removal….let me know.

Even if it is not rated for lead, it is probably a big improvement and does remove a lot of the lead, if it is present.

Bottled water is a good alternative, but as you say, there is no “perfectly” pure water source.

If it were me, I would continue to use the filtered water. Good luck with your pregnancy. Sounds like you are doing everything right.

Best Regards,

Marc

Subject: Flint Water Question from a Pregnant Flint Resident

Dear Dr. Edwards and Dr. Del Toral,

Thank you for the work you have already done in my city to protect families from water contaminant exposure. I am a Flint resident, pregnant with my first child, and therefore advised to drink a whopping 10-16 cups of water each day. I am writing to see if you can shed some light or point me to another source for answers regarding water testing and the safest option for staying hydrated.

If your wife or sister or friend were living in Flint and pregnant, what course of action would you recommend she take? Here is my situation:

- A little background: Prior to becoming pregnant, I installed a pur advanced water filter on our kitchen faucet and always use it when drinking from the tap, which I do frequently. (According to the pur website, the filter is said to filter out 70+ chemicals. Recently, I contacted the company to request more information on exactly what chemicals are filtered and up to what level, and am awaiting their reply.) When using the filter, the water is crystal clear, free of the river smell and without the slight yellow tinge that we sometimes have coming out of the tap (unlike in our bathroom sink which I use to brush my teeth...). I was compelled to purchase the filter because my legs began to swell after Flint changed to the river water, and after installing the filter this problem went away. I even tested the difference by drinking filtered water some days (consistently no swelling) and and unfiltered water others (consistent swelling) for a week or two. I understand the swelling to be the result of sodium chloride in our water which is corrosive enough to make GM stop using Flint water in their local plant (http://www.mlive.com/news/flint/index.ssf/2014/10/general_motors_wont_use_flint.html)

- Given your findings of high levels of lead in some residents' water, my husband strongly believes that I should cease drinking all Flint water and drink bottled water instead. However, I have read extensively about safety concerns of plastic-bottled water (chemists who work with plastics avoid drinking it) and this does not seem to be a safer option despite frequent bottled water drives organized by well-meaning activists across Flint.

- I would like to test our house's tap water with and without the kitchen filter using an independent lab, but my husband thinks this will be a futile effort because we have no reliable way of knowing if the results on one day will be consistent with results on other days, such as if the City of Flint were doing some special change to the water treatment procedure. Would testing multiple times across several weeks be sufficient to address this possibility? If so, how many times and at what interval would you recommend testing, and can you recommend a testing lab? If a high level of lead is discovered, who should we contact to determine where the lead is coming from as a next step?

- According to the consultant that Erin Brockovich sent to Flint earlier this year (http://www.mlive.com/news/flint/index.ssf/2015/02/tthm_how_worried_should_flint.html), total trihalomethanes (TTHM) in the water are dangerous to pregnant women through inhalation exposure during hot showers. (And pregnant women tend to appreciate long, hot showers because our backs are constantly aching!) At this point, the lead issues seem more frightening, though we are considering investing in a costly whole-house water filtration system to deal with both. How can we determine the relative risk to pregnant women for lead in the water vs. TTHMs? I suppose that could differ from house to house. What sort of whole-house filtration would you recommend?

- Are there any other considerations that you think I should keep in mind?

Even for those residents who are privileged to be educated and able to afford water filtration devices, the public water issues we are living with are confounding. The information we receive about our public water supply tends to be fragmented and coming from local public officials who have an interest in downplaying public concerns. In the meantime, it is very difficult to make truly informed decisions about our health.

Thank you in advance for any insights you can share and helping to give my baby a good start in life. I understand if you need to respond as a fellow resident of the world and as experts in general rather than as affiliates of the organizations in which you are employed.

Thank you much,

Thanks Miguel this is helpful. So I think the response should include the following:

- Reference to the sampling protocol you would recommend – I assume that would include little or no pre-flushing. I recall that we have a protocol already established?
- A statement about if elevated levels either add a filter on bath tap or recommend only using filtered tap for consumption. Can also refer them to our web site for flushing protocols as appropriate.

Thanks

Sounds good. I'll wait on Kim and combine everyone into one response. On your questions below...

Will the city test her unfiltered water? If so we can refer her to them.

Yes, the city will test her water, but they do resident-requested testing using pre-flushed 1st draw samples and I cannot in good conscience recommend that. It would miss any lead that is there if she has a lead service line and she would have a false sense of security and may end up being exposed to high lead levels.

Do we have a recommended testing frequency?

The sample collection methodology is far more important than the testing frequency. For example, if frequent (monthly) pre-flushed first-draw samples were collected, you would miss the high lead every time you sample. You would catch lead particles from time to time becasuse they are released sporadically, but that is hit or miss in any given sample. If you collect a set of sequential samples only once, that would provide much better information because it tells you if there is high lead and where it is coming from, but a typical set of sequential samples would involved 12-15 samples at about $25 per sample ($300 - $375), and that's not something the average homeowner can afford. I didn't want to get into all of these details with the resident for obvious resasons. Regarding the bathroom tap...I don't recommend filters for the bathroom tap, so I should have also included a recommendation that if she tests the filtered water from the kitchen tap and it's fine, maybe another recommendation is that only water from the kitchen tap should be used for consumption (cooking/drinking).

- **If there are high levels of lead how to they assess the source?**

The most straightforward way is to collect sequential samples, but as I mentioned that can be expensive, and if you find a lead line, my recommendation would be to use a water filter anyway. Since she is already doing that, I tried to provide advice based on her specific situation.

Subject: RE: Flint Water Question from a Pregnant Flint Resident

Miguel – Thanks for sharing your draft response. I recommend the following:

1. That we send one response that covers both the TTHMs and the Lead questions. Once you have Kim's response then please combine them into one message.

2. I think that she wants to test her water because she only has one filtered tap (the kitchen) and her bath tap is not filtered. She also had a couple other questions which I'm not sure we can answer. To make sure we provide a complete response, I have a couple of questions:

- Will the city test her unfiltered water? If so we can refer her to them.
- Do we have a recommended testing frequency?
- If there are high levels of lead how to they assess the source?

If we are only responding to the question of how to get water tested, I recommend rewording the second paragraph as follows:

~~Regarding the sampling, it can get fairly expensive to collect water samples to characterize lead levels in the untreated and treated water and I don't think that is necessary. If you change the filter in accordance with the manufacturer's instructions, you should be fine. If your concern is regarding the capacity of the filter to remove the lead, you could collect a sample of the filtered water which I think would be more informative and less expensive than trying to characterize the untreated and treated water.~~ If you decide to test your filtered and unfiltered water, you should use a laboratory that has been certified by the State for drinking water analyses (link below).

http://www.michigan.gov/deq/0,4561,7-135-3307_4131_4156-36940--,00.html

Once you have answered my questions above and Kim has developed a response, please send me your updated response. Thanks.

Hi Tinka,

Tom, Rita, Nick and Tim are out, so I wanted to run this by you before responding...

We received an email from a resident in Flint which was also sent to Dr Edwards at Virginia Tech. Below is the email exchange between Dr. Edwards and the resident. I propose to respond to the resident with the draft email below, but wanted to run this by you before I send it. Please advise.

Kim - Please send the draft response on TTHMs to Tinka for review before sending and copy Jen, since she is acting today.

DRAFT RESPONSE

Hello Citizen name / Ex. 6

I agree with Marc's responses on the water filter . Filters that are certified to remove lead are typically designed to remove 99 percent of lead. They are also designed with additional capacity as a safety measure, but you should still change the filter in accordance with the manufacturer's instructions.

Regarding the sampling, it can get fairly expensive to collect water samples to characterize lead levels in the untreated and treated water and I don't think that is necessary. If you change the filter in accordance with the manufacturer's instructions, you should be fine. If your concern is regarding the capacity of the filter to remove the lead, you could collect a sample of the filtered water which I think would be more informative and less expensive than trying to characterize the untreated and treated water. If you decide to test the water, you should use a laboratory that has been certified by the State for drinking water analyses (link below).

Hi Citizen name / Ex. 6

I too thank Miguel for his leadership on this.

I think the filtered water will generally be of very high quality. It is likely that your filtered is rated for lead removal….let me know.

Even if it is not rated for lead, it is probably a big improvement and does remove a lot of the lead, if it is present.

Bottled water is a good alternative, but as you say, there is no "perfectly" pure water source.

If it were me, I would continue to use the filtered water. Good luck with your pregnancy. Sounds like you are doing everything right.

Best Regards,

Marc

Subject: Flint Water Question from a Pregnant Flint Resident

Dear Dr. Edwards and Dr. Del Toral,

Thank you for the work you have already done in my city to protect families from water contaminant exposure. I am a Flint resident, pregnant with my first child, and therefore advised to drink a whopping 10-16 cups of water each day. I am writing to see if you can shed some light or point me to another source for answers regarding water testing and the safest option for staying hydrated.

If your wife or sister or friend were living in Flint and pregnant, what course of action would you recommend she take? Here is my situation:

- A little background: Prior to becoming pregnant, I installed a pur advanced water filter on our kitchen faucet and always use it when drinking from the tap, which I do frequently. (According to the pur website, the filter is said to filter out 70+ chemicals. Recently, I contacted the company to request more information on exactly what chemicals are filtered and up to what level, and am awaiting their reply.) When using the filter, the water is crystal clear, free of the river smell and without the slight yellow tinge that we sometimes have coming out of the tap (unlike in our bathroom sink which I use to brush my teeth...). I was compelled to purchase the filter because my legs began to swell after Flint changed to the river water, and after installing the filter this problem went away. I even tested the difference by drinking filtered water some days (consistently no swelling) and and unfiltered water others (consistent swelling) for a week or two. I understand the swelling to be the result of sodium chloride in our water which is corrosive enough to make GM stop using Flint water in their local plant (http://www.mlive.com/news/flint/index.ssf/2014/10/general_motors_wont_use_flint.html)
- Given your findings of high levels of lead in some residents' water, my husband strongly believes that I should cease drinking all Flint water and drink bottled water instead. However, I have read extensively about safety concerns of plastic-bottled water (chemists who work with plastics avoid drinking it) and this does not seem to be a safer option despite frequent bottled water drives organized by well-meaning activists across Flint.
- I would like to test our house's tap water with and without the kitchen filter using an independent lab, but my husband thinks this will be a futile effort because we have no reliable way of knowing if the results on one day will be consistent with results on other days, such as if the City of Flint were doing some special change to the water treatment procedure. Would testing multiple times across several weeks be sufficient to address this possibility? If so, how many times and at what interval would you recommend testing, and can you recommend a testing lab? If a high level of lead is discovered, who should we contact to determine where the lead is coming from as a next step?

- According to the consultant that Erin Brockovich sent to Flint earlier this year (http://www.mlive.com/news/flint/index.ssf/2015/02/tthm_how_worried_should_flint.html), total trihalomethanes (TTHM) in the water are dangerous to pregnant women through inhalation exposure during hot showers. (And pregnant women tend to appreciate long, hot showers because our backs are constantly aching!) At this point, the lead issues seem more frightening, though we are considering investing in a costly whole-house water filtration system to deal with both. How can we determine the relative risk to pregnant women for lead in the water vs. TTHMs? I suppose that could differ from house to house. What sort of whole-house filtration would you recommend?

- Are there any other considerations that you think I should keep in mind?

Even for those residents who are privileged to be educated and able to afford water filtration devices, the public water issues we are living with are confounding. The information we receive about our public water supply tends to be fragmented and coming from local public officials who have an interest in downplaying public concerns. In the meantime, it is very difficult to make truly informed decisions about our health.

Thank you in advance for any insights you can share and helping to give my baby a good start in life. I understand if you need to respond as a fellow resident of the world and as experts in general rather than as affiliates of the organizations in which you are employed.

Thank you much,

jeopardy.

But it was the result of a third test of the tap water in her home, performed by independent experts at Virginia Tech university, that most stunned Walters.

“It took a while for me to wrap my head around it,” said Walters.

The VT researchers discovered lead levels in Walters’ water reached a jaw-dropping 13,200 ppb—more than twice the amount at which the U.S. Environmental Protection Agency classifies water as hazardous waste.

“When I saw those numbers I was shocked,” said Virginia Tech professor Marc Edwards, a former MacArthur Fellow and respected authority on corrosion in drinking-water systems, who oversaw the tests.

Edwards played a key role in discovering the problem of corroded water pipes and lead in Washington, D.C. drinking water during the early 2000s, in what has been described as one of the worst contamination events ever seen in an urban water system, with resulting increased incidence of childhood lead poisoning, miscarriages and fetal death.

In terms of lead levels, the Walters family’s numbers eclipsed even the worst D.C. homes.

“I have never in my 25-year career seen such outrageously high levels going into another home in the United States,” said Edwards. “This was literally hazardous-waste levels.”

But the condition of Walters’ tap water raises a much more far-reaching question: Since the city moved away from Detroit’s water system and began pumping water from the Flint River, how many other families have been put at risk by the city's questionable testing procedures and handling of the water supply?

The Walters family surely isn't alone in dealing with the threat of lead-laced drinking water. About half of Flint's 40,000 homes are a half-century old or older, built at a time when water service lines were typically made of lead.

And according to various experts, including an EPA water-quality specialist, the city's actions are only exacerbating the threat.

"What the public needs is accurate information," explained Miguel Del Toral, regulations manager for the Ground Water and Drinking Water Branch of the EPA's Region 5.

Instead, the city is utilizing testing measures that almost ensure that worst-case scenarios such as the one facing the Walters family escape detection, asserted Del Toral in an internal EPA memo provided to the ACLU of Michigan.

Compounding the threat is what Del Toral describes as the continued inability of officials to adequately treat water coming into people's homes from the Flint River.

"I don't want to scare people unnecessarily," said Del Toral in a phone interview from his home in Chicago. "But there is absolutely a problem in Flint that needs to be addressed right away."

During his interview with the ACLU of Michigan, Del Toral said he was willing to go on the record with his concerns, but that he was doing so as a private citizen, not as a representative of the EPA.

EPA rules, he said, required that such interviews be routed through the agency's public affairs people. But he's willing to speak out nonetheless, he said, because of the potential harm to the public is so great, and the need to address it is so urgent.

WATERING DOWN THE TESTS

Perhaps the most vexing problem in all of this is the contamination caused by the city's decades-old network of lead and iron pipes—a problem directly connected to the switch to river water, and the city's failure to adequately treat it.

Under the U.S. Environmental Protection Agency's rules, if lead reaches a level of 15 parts per billion in water, the source of the problem must be identified and corrected.

In early March, after months of requests (and only after Walters had received a doctor's note raising concerns about problems with the water), the city finally conducted a test. It found lead levels of 104 ppb the first time. A second test recorded a level of 397 ppb.

Blood tests, taken after those water-sample numbers were reported, revealed that one of her children, a four year old, had lead poisoning.

The news was devastating, said Walters, and the concern it creates for her child's future is haunting.

"Lead can affect almost every organ and system in your body," according to the EPA's web site. "Children six years old and younger are most susceptible … Even low levels of lead in the blood of children can result in: behavior and learning problems; lower IQ and hyperactivity; slowed growth; and hearing problems."

Those dangers made Walters all the more determined to get her questions answered.

For one thing, she wanted to know why residents were being instructed to “pre-flush” water lines before drawing samples that would be tested by the city

After much searching, she found Del Toral at the EPA’s Region 5 in Chicago. He explained to her that her instincts were right, and that she had good cause to be concerned about the way testing was being done.

“The practice of pre-flushing before collecting compliance samples has been shown to result in the minimization of lead capture and significant underestimation of lead levels in drinking water,” wrote Del Toral in an internal memo dated June 24.

Del Toral went on to say that the city’s testing methods were a “serious concern” because they “could provide a false sense of security to the residents of Flint regarding lead levels in the water.” As a result, he warned, residents could fail to take the necessary precautions to protect their families from lead in the drinking water.

Virginia Tech’s Edwards completely agrees with Del Toral’s assessment.

“The net effect of a ‘pre-flush’ is to greatly reduce the likelihood of detecting lead in samples collected … that would normally be present in the consumers drinking water,” Edwards wrote in an email. “I have long maintained that the practice should be banned, as it artificially lowers the amount of lead detected in samples versus typical consumer exposure.”

Asked about these concerns, city spokesman Jason Lorenz offered the following email reply: “While I cannot directly respond to Mr. Del Toral's remarks without first contacting the EPA Region 5 office, I can say that the City of Flint follows all the testing procedures and schedules as required by the U.S. EPA.”

He added that the Michigan Department of Environmental Quality (MDEQ) endorses the city's sampling method. The MDEQ did not respond to phone calls and e-mails seeking its comments on the controversy.

Del Toral contended in an interview that what Flint's doing is actually exploiting a "loophole" in the law.

"From a technical standpoint, there's no justification for the way Flint is conducting its tests," Del Toral said. "Any credible scientist will tell you [the city's] method is not the way to catch worst-case conditions."

There is no legitimate reason for the city's methodology, said Del Toral.

EPA rules, he said, required that such interviews be routed through the agency's public affairs people. But he was willing to speak out nonetheless, he said, because of the potential harm to the public.

FLUSHING OUT REAL ANSWERS

It was Del Toral who, after determining that the lead problem plaguing the Walters family was coming from outside their home, connected LeeAnne with Edwards at Virginia Tech.

Instead of taking a single sample after a line had been "pre-flushed" under the city's direction, Edwards instructed Walters to collect a series of samples from water that had been allowed to sit in the service line long enough to accurately reflect levels the family could be exposed to under normal use.

(Meanwhile, that same service line, dug up and replaced after the sample collection, was found to be made of lead in one section and iron in another.)

Edwards tested the water and discovered that the lead contamination ranged from 200 ppb to the 13,200 ppb figure that stunned LeeAnne Walters—and should likewise shock many others.

Given the age of much of Flint's infrastructure, Edwards agrees with Del Toral's assessment that the test results they found at the Walters home amount to an alarm going off, and others in the city need to pay attention.

"I do not see any reason why there would not be serious problems occurring in at least some other Flint homes," said Edwards.

In 1986, the U.S. Safe Drinking Water Act was amended to prohibit the use of lead pipes in public water systems. Every house built before that is potentially at risk, said Edwards. About half of Flint's roughly 40,000 homes are at least 50 years old.

Making things worse is the fact that the high levels of chlorine being used to treat Flint's dirty river water lead to the creation of a carcinogenic byproduct know as total trihalomethanes, or TTHM. To keep TTHM levels down, the city is adding ferric chloride. The trouble is, that additive can also accelerate the corrosion of lead and iron pipes.

Adding yet another layer to the problem is something the city is not doing.

According to Del Toral, Flint should be adding corrosion-control chemicals designed to help keep lead and copper in pipes from leaching into drinking water. Doing so is required by federal regulations, wrote Del Toral in his memo.

"To our knowledge, that is inaccurate," said Flint spokesman Lorenz. "Before the plant was placed in operation, the City (and our engineering firm) had numerous discussions with DEQ personnel and inquired if corrosion-control chemicals –

typically phosphates --needed to be included in the treatment process. The use of these chemicals was not required or mandated."

What's indisputable is this:

Flint's water contained corrosion-control chemicals until April 2014, when Flint's ties to the Detroit water system were severed. Flint officials hailed that changeover as a cost-cutting move for a city facing a financial crisis so severe it had been placed under the control of a state-appointed emergency manager.

Discontinuing the use of the anti-corrosion chemicals allowed toxic scale built up on the insides of pipes over the past decades to be released into water flowing into people's homes, explained Del Toral.

In his memo, Del Toral warned: "The lack of mitigating treatment is especially concerning as the high lead levels [that result] will likely not be reflected in the City of Flint's compliance samples due to sampling procedures used…"

In other words, at the same time the city is exacerbating the problem, it's conducting tests that will probably fail to identify the true extent of the threat.

Del Toral described the situation as a "major concern."

"In the absence of any corrosion control treatment, lead levels in drinking water can be expected to increase," he warned in his memo.

The EPA offered Flint officials the use of agency experts to help get the situation under control, said Del Toral, but added that, to his knowledge, the city has so far declined all help.

LeeAnne Walters said that when she asked why city officials weren't taking the EPA's offer of assistance, she was told, "We don't need it."

Flint spokesman Lorenz, on the other hand, maintained that "the city continues to work closely with the MDEQ and the EPA Regional Office."

As for Walters's family, that the city has finally replaced the service line leading to their home, and lead levels have dropped below the 15 ppb EPA action level.

The problem now, she said, is that water currently coming out of her tap tinged yellow and smells of rotten eggs. City officials have given her no explanation as to the possible cause of that.

It is just one more in a long list of questions that need to be addressed.

"What we need," said Walters, "are more answers."

But it's not just answers the people of Flint require.

They also need solutions. And, as Del Toral's EPA memo emphasizes, they need them immediately.

Summary of Inaccurate statements and mischaracterizations

It took a while for LeeAnne Walters to realize the full impact of the number: 13,200. Walters—a stay-at home mom with four sons and a husband in the Navy—had seen other numbers reflecting the quality of drinking water at her Flint home that were devastating. But 13,200? She'd never seen anything like this.

The ACLU should revise the article to include more specifics on the high results so as not to unduly alarm the residents of Flint. The very high lead levels discovered in the samples were from the Walters' residence after the water had been stagnant in the service line for almost a month (April 3, 2015 to April 27, 2015). The Walters' service line configuration and long length is also likely not what would be found in most typical homes in Flint. Using the information in an unexplained or unqualified manner can lead to residents inferring that their situations could be the same.

The Walters family surely isn't alone in dealing with the threat of lead-laced drinking water. About half of Flint's 40,000 homes are a half-century old or older, built at a time when water service lines were typically made of lead.

Although there certainly are lead lines in Flint, EPA does not have information to indicate when lead service lines were used or not used in Flint. Unless the period of time that lead lines were used is known to the ACLU, it should not be assumed that lead lines were used during this time. Many cities stopped using lead lines in the 1920s, 1930s, 1940s, etc.

Del Toral contended in an interview that what Flint's doing is actually exploiting a "loophole" in the law.

"From a technical standpoint, there's no justification for the way Flint is conducting its tests," Del Toral said. "Any credible scientist will tell you [the city's] method is not the way to catch worst-case conditions."

There is no legitimate reason for the city's methodology, said Del Toral.

The Lead and Copper Rule is silent on the issue of pre-flushing before collecting compliance samples. It does not include pre-flushing instructions or prohibit it. EPA is concerned with the potential impact of pre-flushing, particularly in the absence of treatment for lead, and we are in discussions with the MDEQ on this issue.

EPA rules, he said, required that such interviews be routed through the agency's public affairs people. But he was willing to speak out nonetheless, he said, because of the potential harm to the public.

Miguel simply agreed to answer questions on the report in his personal capacity.

Instead of taking a single sample after a line had been "pre-flushed" under the city's direction, Edwards instructed Walters to collect a series of samples from water that had been allowed to sit in the service line long enough to accurately reflect levels the family could be exposed to under normal use.

This characterization is not accurate/misleading. Prior to the collection of the samples, the water was not used in the home from April 3, 2015 to April 27, 2015. This is not how water is used in a typical home. The ACLU should explain how the conditions under which the samples were collected and the atypical (very long) service line at the Walters' residence, to

put these results in the proper context.

Given the age of much of Flint's infrastructure, Edwards agrees with Del Toral's assessment that the test results they found at the Walters home amount to an alarm going off, and others in the city need to pay attention.
This is a mischaracterization of what I said. I did not say this about the VT sampling. I said this about the samples collected by the City of Flint from the Walters' home (104 ppb & 397 ppb). It was with respect to the lack of any mitigating treatment, and my professional opinion regarding the disintegration of the existing scales formed during the time phosphate treated water was provided by Detroit, which would be occurring city-wide.

According to Del Toral, Flint should be adding corrosion-control chemicals designed to help keep lead and copper in pipes from leaching into drinking water. Doing so is required by federal regulations, wrote Del Toral in his memo.
This is not an accurate statement. What I said was that large systems were required to install and maintain optimal corrosion control, unless the system meets the treatment exemption criteria in the Lead and Copper Rule.

The EPA offered Flint officials the use of agency experts to help get the situation under control, said Del Toral, but added that, to his knowledge, the city has so far declined all help.
This is not accurate. EPA has discussed the offer of technical assistance to the City of Flint with MDEQ. The RA subsequently sent the resumes of two EPA experts to the Mayor.

---**[End of summary]**--

Introductory comment: I quit work early one day and Ms. Walters called that day after I had quit work and asked if I would speak to the ACLU. I told Ms. Walters that I had no authority to speak to the ACLU on behalf of EPA and that he should contact our public affairs office if he wanted comments from EPA. Ms. Walters indicated that he just wanted to better understand some of the issues and I reiterated that although I was willing to speak to him in my personal capacity, I wanted it to be very clear that I am not speaking on behalf of EPA and that any questions I answer are not to portrayed as EPA comments or responses. I also reiterated the same to the ACLU when Mr. Guyette called later that day. The language in the article seems to convey that I was the one that initiated the contact with the ACLU out of concern with the situation in Flint. I did not contact the ACLU, offer to contact the ACLU or have any intent to do so in my EPA or personal capacity regarding Flint or any other drinking water issue. I do contact the ACLU for other non-work issues and discussed those with Attorney Client / Ex. 5

Attorney Client / Ex. 5

bankers and tax lawyers sifting through tax law to avoid tax liabilities, I want to comply with the letter and the spirit of the ethics regulations and I am willing to work with EPA to clarify the training regarding outside activities so that others don't have to go through this. I will be

Attorney Client / Ex. 5

The central issue I focused on in my discussion with the ACLU was the need for Flint to evaluate treatment on a system-wide basis, and the EPA offer to provide technical assistance so that they are not fixing one problem (E.coli and Coliform MCL violations) only to cause another problem (TTHM MCL violations).

It took a while for LeeAnne Walters to realize the full impact of the number: 13,200.

MDT comment: I tried to make it clear that using these results could unduly alarm the public. I stressed is that we do not want to unduly alarm the residents in Flint, and I said this more than once regarding the very high lead at the Citizen name / Ex. 6 *home. I said we had never seen lead levels this high in drinking water and we had no information that would tell us if the Walters' home was unique or whether there were any other homes with similar configurations. I also said that these results were from sampling conducted after the water in that service line had not been used for almost a month, so it is very likely not representative of what we would expect to find in most homes in Flint unless* Citizen name / Ex. 6 *service line configuration is more common than we think, which is doubtful. Mr. Guyette chose to use the highest result from that sampling set and without proper qualification.*

Walters—a stay-at home mom with four sons and a husband in the Navy—had seen other numbers reflecting the quality of drinking water at her Flint home that were devastating. But 13,200? She'd never seen anything like this.

The city had tested her water twice in this past March and both times found dangerously high levels of lead—104 parts per billion (ppb) and 397 ppb, respectively.

Those numbers filled her with dread, because they meant her family had been exposed to high levels of a terribly toxic heavy metal that put her children's future in jeopardy.

But it was the result of a third test of the tap water in her home, performed by independent experts at Virginia Tech university, that most stunned Walters.

"It took a while for me to wrap my head around it," said Walters.

The VT researchers discovered lead levels in Walters' water reached a jaw-dropping 13,200 ppb—more than twice the amount at which the U.S. Environmental Protection Agency classifies water as hazardous waste.

"When I saw those numbers I was shocked," said Virginia Tech professor Marc Edwards, a former MacArthur Fellow and respected authority on corrosion in drinking-water systems, who oversaw the tests.

Edwards played a key role in discovering the problem of corroded water pipes and lead in Washington, D.C. drinking water during the early 2000s, in what has been described as one of the *worst* contamination events ever seen in an urban water system, with resulting increased incidence of childhood lead poisoning, miscarriages and fetal death.

In terms of lead levels, the Walters family's numbers eclipsed even the worst D.C. homes.

"I have never in my 25-year career seen such outrageously high levels going into another home in the United States," said Edwards. "This was literally hazardous-waste levels."

But the condition of Walters' tap water raises a much more far-reaching question: Since the city moved away from Detroit's water system and began pumping water from the Flint River, how many other families have been put at risk by the city's questionable testing procedures and handling of the water supply?

The Walters family surely isn't alone in dealing with the threat of lead-laced drinking water. About half of Flint's 40,000 homes are a half-century old or older, built at a time when water service lines were typically made of lead.

MDT: This did not come from me. Flint definitely used lead lines, but I have no idea whatsoever when they stopped using lead lines in Flint.

And according to various experts, including an EPA water-quality specialist, the city's actions are only exacerbating the threat.

"What the public needs is accurate information," explained Miguel Del Toral, regulations manager for the Ground Water and Drinking Water Branch of the EPA's Region 5.

MDT: This was part of my trying to stress that we should not unduly alarm people.

Instead, the city is utilizing testing measures that almost ensure that worst-case scenarios such as the one facing the Walters family escape detection, asserted Del Toral in an internal EPA memo provided to the ACLU of Michigan.

Compounding the threat is what Del Toral describes as the continued inability of officials to adequately treat water coming into people's homes from the Flint River.

MDT: The main focus of what I told the ACLU was that Flint has gone from essentially a finishing operation at the treatment plant to a raw water treatment plant and is dealing with a number of drinking water issues and could benefit from expert assistance in simultaneously complying across all drinking water regulations.

"I don't want to scare people unnecessarily," said Del Toral in a phone interview from his home in Chicago. "But there is absolutely a problem in Flint that needs to be addressed right away."

MDT: My comment was specifically on lead. In the absence of treatment we expect that lead levels will increase due to the presence of lead service lines. The concerns that the Region has and the actions to be taken are scheduled for discussion with MDEQ later in July.

During his interview with the ACLU of Michigan, Del Toral said he was willing to go on the record with his concerns, but that he was doing so as a private citizen, not as a representative of the EPA.

EPA rules, he said, required that such interviews be routed through the agency's public affairs people. But he's willing to speak out nonetheless, he said, because of the potential harm to the public is so great, and the need to address it is so urgent.

MDT: What I said was that I was not authorized to speak on behalf of EPA and that if he wanted EPA's comments he should contact public affairs.

WATERING DOWN THE TESTS

Perhaps the most vexing problem in all of this is the contamination caused by the city's decades-old network of lead and iron pipes—a problem directly connected to the switch to river water, and the city's failure to adequately treat it.

Under the U.S. Environmental Protection Agency's rules, if lead reaches a level of 15 parts per billion in water, the source of the problem must be identified and corrected.

In early March, after months of requests (and only after Walters had received a doctor's note raising concerns about problems with the water), the city finally conducted a test. It found lead levels of 104 ppb the first time. A second test recorded a level of 397 ppb.

Blood tests, taken after those water-sample numbers were reported, revealed that one of her children, a four year old, had lead poisoning.

The news was devastating, said Walters, and the concern it creates for her child's future is haunting.

"Lead can affect almost every organ and system in your body," according to the EPA's web site. "Children six years old and younger are most susceptible … Even low levels of lead in the blood of children can result in: behavior and learning problems; lower IQ and hyperactivity; slowed growth; and hearing problems."

Those dangers made Walters all the more determined to get her questions answered.

For one thing, she wanted to know why residents were being instructed to "pre-flush" water lines before drawing samples that would be tested by the city

After much searching, she found Del Toral at the EPA's Region 5 in Chicago. He explained to her that her instincts were right, and that she had good cause to be concerned about the way testing was being done.

"The practice of pre-flushing before collecting compliance samples has been shown to result in the minimization of lead capture and significant underestimation of lead levels in drinking water," wrote Del Toral in an internal memo dated June 24.

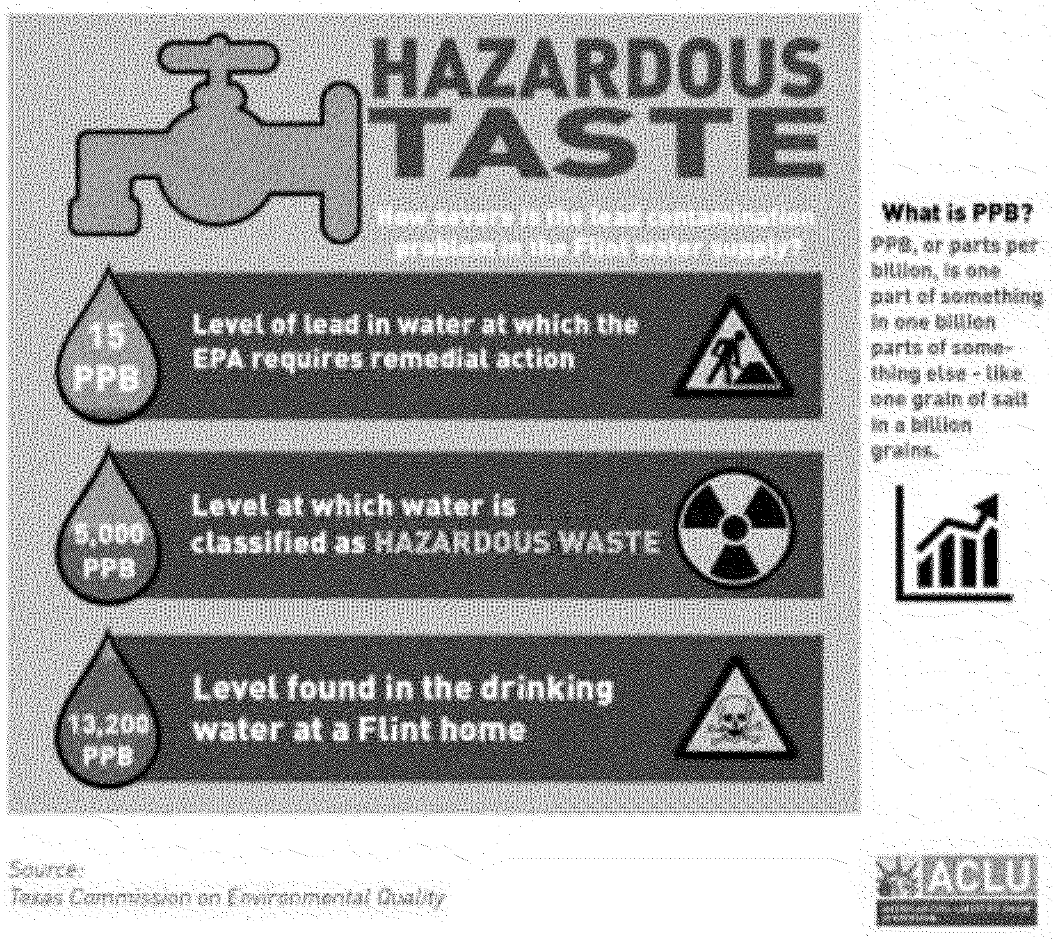
Del Toral went on to say that the city's testing methods were a "serious concern" because they "could provide a false sense of security to the residents of Flint regarding lead levels in the water." As a result, he warned, residents could fail to take the necessary precautions to protect their families from lead in the drinking water.

Virginia Tech's Edwards completely agrees with Del Toral's assessment.

"The net effect of a 'pre-flush' is to greatly reduce the likelihood of detecting lead in samples collected … that would normally be present in the consumers drinking water," Edwards wrote in an email. "I have long maintained that the practice should be banned, as it artificially lowers the amount of lead detected in samples versus typical consumer exposure."

Asked about these concerns, city spokesman Jason Lorenz offered the following email reply: "While I cannot directly respond to Mr. Del Toral's remarks without first contacting the EPA Region 5 office, I can say that the City of Flint follows all the testing procedures and schedules as required by the U.S. EPA."

He added that the Michigan Department of Environmental Quality (MDEQ) endorses the city's sampling method. The MDEQ did not respond to phone calls and e-mails seeking its comments on the controversy.



HAZARDOUS TASTE
How severe is the lead contamination problem in the Flint water supply?
15 PPB
Level of lead in water at which the EPA requires remedial action
5,000 PPB
Level at which water is classified as HAZARDOUS WASTE
13,200 PPB
Level found in the drinking water at a Flint home
What is PPB?
PPB, or parts per billion, is one part of something in one billion parts of something else - like one grain of salt in a billion grains.
ACLU

Source:
Texas Commission on Environmental Quality

Del Toral contended in an interview that what Flint's doing is actually exploiting a "loophole" in the law.

MDT: Unfortunately, I can't recall exactly what I said on this. Flint, as well as all other systems in Michigan are following the MDEQ guidance which includes the pre-flushing.

"From a technical standpoint, there's no justification for the way Flint is conducting its tests," Del Toral said. "Any credible scientist will tell you [the city's] method is not the way to catch worst-case conditions."

There is no legitimate reason for the city's methodology, said Del Toral.

MDT: Again, this is ACLU wording. I think I said something like there was no technical reason for pre-flushing (i.e., it is not something that is done in response to a problem with the EPA sampling method).

EPA rules, he said, required that such interviews be routed through the agency's public affairs people. But he was willing to speak out nonetheless, he said, because of the potential harm to the public.

MDT: See above comment on this issue.

FLUSHING OUT REAL ANSWERS

It was Del Toral who, after determining that the lead problem plaguing the Walters family was coming from outside their home, connected LeeAnne with Edwards at Virginia Tech.

Instead of taking a single sample after a line had been "pre-flushed" under the city's direction, Edwards instructed Walters to collect a series of samples from water that had been allowed to sit in the service line long enough to accurately reflect levels the family could be exposed to under normal use.

MDT: This is not accurate. The water sat in the pipes from April 3, 2015 through April 27, 2015, which is not typical of average household usage.

(Meanwhile, that same service line, dug up and replaced after the sample collection, was found to be made of lead in one section and iron in another.)

Edwards tested the water and discovered that the lead contamination ranged from 200 ppb to the 13,200 ppb figure that stunned LeeAnne Walters—and should likewise shock many others.

Given the age of much of Flint's infrastructure, Edwards agrees with Del Toral's assessment that the test results they found at the Walters home amount to an alarm going off, and others in the city need to pay attention.

MDT: This is a mischaracterization of what I said. I did not say this about the VT sampling. I said this about the samples collected by the City of Flint from the Walters' home (104 ppb & 397 ppb). It was with respect to the lack of any mitigating treatment, and my professional opinion regarding the disintegration of the existing scales formed during the time phosphate treated water was provided by Detroit, which would be occurring city-wide.

"I do not see any reason why there would not be serious problems occurring in at least some other Flint homes," said Edwards.

In 1986, the U.S. Safe Drinking Water Act was amended to prohibit the use of lead pipes in public water systems. Every house built before that is potentially at risk, said Edwards. About half of Flint's roughly 40,000 homes are at least 50 years old.

Making things worse is the fact that the high levels of chlorine being used to treat Flint's dirty river water lead to the creation of a carcinogenic byproduct know as total trihalomethanes, or TTHM. To keep TTHM levels down, the city is adding ferric chloride. The trouble is, that additive can also accelerate the corrosion of lead and iron pipes.

Adding yet another layer to the problem is something the city is *not* doing.

According to Del Toral, Flint should be adding corrosion-control chemicals designed to help keep lead and copper in pipes from leaching into drinking water. Doing so is required by federal regulations, wrote Del Toral in his memo.

MDT: This is not an accurate statement. What I said was that large systems were required to install and maintain optimal corrosion control, unless the system meets the treatment exemption criteria in the Lead and Copper Rule.

"To our knowledge, that is inaccurate," said Flint spokesman Lorenz. "Before the plant was placed in operation, the City (and our engineering firm) had numerous discussions with DEQ personnel and inquired if corrosion-control chemicals – typically phosphates --needed to be included in the treatment process. The use of these chemicals was not required or mandated."

What's indisputable is this:

Flint's water contained corrosion-control chemicals until April 2014, when Flint's ties to the Detroit water system were severed. Flint officials hailed that changeover as a cost-cutting move for a city facing a financial crisis so severe it had been placed under the control of a state-appointed emergency manager.

Discontinuing the use of the anti-corrosion chemicals allowed toxic scale built up on the insides of pipes over the past decades to be released into water flowing into people's homes, explained Del Toral.

In his memo, Del Toral warned: "The lack of mitigating treatment is especially concerning as the high lead levels [that result] will likely not be reflected in the City of Flint's compliance samples due to sampling procedures used…"

In other words, at the same time the city is exacerbating the problem, it's conducting tests that will probably fail to identify the true extent of the threat.

Del Toral described the situation as a "major concern."

"In the absence of any corrosion control treatment, lead levels in drinking water can be expected to increase," he warned in his memo.

The EPA offered Flint officials the use of agency experts to help get the situation under control, said Del Toral, but added that, to his knowledge, the city has so far declined all help.

MDT: This is inaccurate. My standing recommendation to R5 management is to pursue this and that has not played out yet. He may be mixing up what I said with what Ms. Walters said (see below).

LeeAnne Walters said that when she asked why city officials weren't taking the EPA's offer of assistance, she was told, "We don't need it."

Flint spokesman Lorenz, on the other hand, maintained that “the city continues to work closely with the MDEQ and the EPA Regional Office.”

As for Walters’s family, that the city has finally replaced the service line leading to their home, and lead levels have dropped below the 15 ppb EPA action level.

The problem now, she said, is that water currently coming out of her tap tinged yellow and smells of rotten eggs. City officials have given her no explanation as to the possible cause of that.

It is just one more in a long list of questions that need to be addressed.

“What we need,” said Walters, “are more answers.”

But it’s not just answers the people of Flint require.

They also need solutions. And, as Del Toral’s EPA memo emphasizes, they need them immediately.

Subject: RE: Flint Water Question from a Pregnant Flint Resident

Hi Miguel,

Below is my recommended response to the TTHM question.

Regarding your TTHM question, we considered developmental and reproductive risks from multiply intake routes of exposure (e.g., ingestion, inhalation, and dermal) in our 2006 Disinfectants and Disinfection Byproducts (DBPR) rule. Some studies did suggest associations between TTHM exposure and various adverse reproductive and development health effects. However, studies available overall showed inconsistent results. As such, our Agency could not conclude whether exposure to TTHMs could cause adverse reproductive/developmental health effects. However, we did note in our findings that there was the potential for concern.

Currently, we are in the process of re-evaluating our DBPR rules and considering new toxicological data regarding reproductive and developmental health effects. Until our evaluation is complete, pregnant women can elect to take additional precautionary measures such as taking shorter showers, venting the room while showering/bathing, and not ingesting water with high TTHM concentrations.

Hope that helps,

Kim

Yes, but they are pre-flushed 1st-draw samples. As I mentioned to Tinka, I cannot recommend that.

Thanks Miguel this is helpful. So I think the response should include the following:

- Reference to the sampling protocol you would recommend – I assume that would include little or no pre-flushing. I recall that we have a protocol already established?
- A statement about if elevated levels either add a filter on bath tap or recommend only using filtered tap for consumption. Can also refer them to our web site for flushing protocols as appropriate.

Thanks

Subject: Re: Flint Water Question from a Pregnant Flint Resident

Sounds good. I'll wait on Kim and combine everyone into one response. On your questions below...

Will the city test her unfiltered water? If so we can refer her to them.

Yes, the city will test her water, but they do resident-requested testing using pre-flushed 1st draw samples and I cannot in good conscience recommend that. It would miss any lead that is there if she has a lead service line and she would have a false sense of security and may end up being exposed to high lead levels.

Do we have a recommended testing frequency?

The sample collection methodology is far more important than the testing frequency. For example, if frequent (monthly) pre-flushed first-draw samples were collected, you would miss the high lead every time you sample. You would catch lead particles from time to time becasuse they are released sporadically, but that is hit or miss in any given sample. If you collect a set of sequential samples only once, that would provide much better information because it tells you if there is high lead and where it is coming from, but a typical set of sequential samples would involved 12-15 samples at about $25 per sample ($300 - $375), and that's not something the average homeowner can afford. I didn't want to get into all of these details with the resident for obvious resasons. Regarding the bathroom tap...I don't recommend filters for the bathroom tap, so I should have also included a recommendation that if she tests the filtered water from the kitchen tap and it's fine, maybe another recommendation is that only water from the kitchen tap should be used for consumption (cooking/drinking).

- **If there are high levels of lead how to they assess the source?**

The most straightforward way is to collect sequential samples, but as I mentioned that can be expensive, and if you find a lead line, my recommendation would be to use a water filter anyway. Since she is already doing that, I tried to provide advice based on her specific situation.

Subject: RE: Flint Water Question from a Pregnant Flint Resident

Miguel – Thanks for sharing your draft response. I recommend the following:

1. That we send one response that covers both the TTHMs and the Lead questions. Once you have Kim's response then please combine them into one message.

2. I think that she wants to test her water because she only has one filtered tap (the kitchen) and her bath tap is not filtered. She also had a couple other questions which I'm not sure we can answer. To make sure we provide a complete response, I have a couple of questions:

- Will the city test her unfiltered water? If so we can refer her to them.
- Do we have a recommended testing frequency?
- If there are high levels of lead how to they assess the source?

If we are only responding to the question of how to get water tested, I recommend rewording the second paragraph as follows:

~~Regarding the sampling, it can get fairly expensive to collect water samples to characterize lead levels in the untreated and treated water and I don't think that is necessary. If you change the filter in accordance with the manufacturer's instructions, you should be fine. If your concern is regarding the capacity of the filter to remove the lead, you could collect a sample of the filtered water which I think would be more informative and less expensive than trying to characterize the untreated and treated water.~~ If you decide to test your filtered and unfiltered water, you should use a laboratory that has been certified by the State for drinking water analyses (link below).

http://www.michigan.gov/deq/0,4561,7-135-3307_4131_4156-36940--,00.html

Once you have answered my questions above and Kim has developed a response, please send me your updated response. Thanks.

Subject: Fw: Flint Water Question from a Pregnant Flint Resident

Hi Tinka,

Tom, Rita, Nick and Tim are out, so I wanted to run this by you before responding...

We received an email from a resident in Flint which was also sent to Dr Edwards at Virginia Tech. Below is the email exchange between Dr. Edwards and the resident. I propose to respond to the resident with the draft email below, but wanted to run this by you before I send it. Please advise.

Kim - Please send the draft response on TTHMs to Tinka for review before sending and copy Jen, since she is acting today.

DRAFT RESPONSE

Hello Citizen name / Ex. 6

I agree with Marc's responses on the water filter . Filters that are certified to remove lead are typically designed to remove 99 percent of lead. They are also designed with additional capacity as a safety measure, but you should still change the filter in accordance with the manufacturer's instructions.

Regarding the sampling, it can get fairly expensive to collect water samples to characterize lead levels in the untreated and treated water and I don't think that is necessary. If you change the filter in accordance with the manufacturer's instructions, you should be fine. If your concern is regarding the capacity of the filter to remove the lead, you could collect a sample of the filtered water which I think would be more informative and less expensive than trying to characterize the untreated and treated water. If you decide to test the water, you should use a laboratory that has been certified by the State for drinking water analyses (link below).

http://www.michigan.gov/deq/0,4561,7-135-3307_4131_4156-36940--,00.html

Regarding your questions on the TTHMs, I am not a health effects expert, so I am forwarding your email to Kimberly Harris for response.

Regards,

Miguel Del Toral

Hi Kim,

See email exchange below. I think Marc's responses are fine on the lead, but we need to respond to the TTHM/showering questions, which I think you have responded in the past. Please forward your draft response to Tinka for review prior to responding.

Subject: Re: Flint Water Question from a Pregnant Flint Resident

Marc, thank you for your quick reply and thoughtful feedback. I appreciate it very much. You are correct that the faucet filter is rated to remove 99% of lead contamination. What I am not certain about is whether that level of removal is variable based on the amount of lead coming to the faucet. I suppose that if a higher lead level would just result in the filter needing replacement sooner rather than passing more through the filter and into my drinking glass. Please correct me if this is a mistaken assumption.

Again, thank you, and Miguel I appreciate any recommendations you may have as well.

All the best,

Citizen name / Ex. 6

On Sat, Jul 11, 2015 at 8:31 PM, Marc Edwards <edwardsm@vt.edu> wrote:

Hi Citizen name / Ex. 6

I too thank Miguel for his leadership on this.

I think the filtered water will generally be of very high quality. It is likely that your filtered is rated for lead removal….let me know.

Even if it is not rated for lead, it is probably a big improvement and does remove a lot of the lead, if it is present.

Bottled water is a good alternative, but as you say, there is no "perfectly" pure water source.

If it were me, I would continue to use the filtered water. Good luck with your pregnancy. Sounds like you are doing everything right.

Best Regards,

Marc

Subject: Flint Water Question from a Pregnant Flint Resident

Dear Dr. Edwards and Dr. Del Toral,

Thank you for the work you have already done in my city to protect families from water contaminant exposure. I am a Flint resident, pregnant with my first child, and therefore advised to drink a whopping 10-16 cups of water each day. I am writing to see if you can shed some light or point me to another source for answers regarding water testing and the safest option for staying hydrated.

If your wife or sister or friend were living in Flint and pregnant, what course of action would you recommend she take? Here is my situation:

- A little background: Prior to becoming pregnant, I installed a pur advanced water filter on our kitchen faucet and always use it when drinking from the tap, which I do frequently. (According to the pur website, the filter is said to filter out 70+ chemicals. Recently, I contacted the company to request more information on exactly what chemicals are filtered and up to what level, and am awaiting their reply.) When using the filter, the water is crystal clear, free of the river smell and without the slight yellow tinge that we sometimes have coming out of the tap (unlike in our bathroom sink which I use to brush my teeth...). I was compelled to purchase the filter because my legs began to swell after Flint changed to the river water, and after installing the filter this problem went away. I even tested the difference by drinking filtered water some days (consistently no swelling) and and unfiltered water others (consistent swelling) for a week or two. I understand the swelling to be the result of sodium chloride in our water which is corrosive enough to make GM stop using Flint water in their local plant (http://www.mlive.com/news/flint/index.ssf/2014/10/general_motors_wont_use_flint.html)
- Given your findings of high levels of lead in some residents' water, my husband strongly believes that I should cease drinking all Flint water and drink bottled water instead. However, I have read extensively about safety concerns of plastic-bottled water (chemists who work with plastics avoid drinking it) and this does not seem to be a safer option despite frequent bottled water drives organized by well-meaning activists across Flint.

- I would like to test our house's tap water with and without the kitchen filter using an independent lab, but my husband thinks this will be a futile effort because we have no reliable way of knowing if the results on one day will be consistent with results on other days, such as if the City of Flint were doing some special change to the water treatment procedure. Would testing multiple times across several weeks be sufficient to address this possibility? If so, how many times and at what interval would you recommend testing, and can you recommend a testing lab? If a high level of lead is discovered, who should we contact to determine where the lead is coming from as a next step?

- According to the consultant that Erin Brockovich sent to Flint earlier this year (http://www.mlive.com/news/flint/index.ssf/2015/02/tthm_how_worried_should_flint.html), total trihalomethanes (TTHM) in the water are dangerous to pregnant women through inhalation exposure during hot showers. (And pregnant women tend to appreciate long, hot showers because our backs are constantly aching!) At this point, the lead issues seem more frightening, though we are considering investing in a costly whole-house water filtration system to deal with both. How can we determine the relative risk to pregnant women for lead in the water vs. TTHMs? I suppose that could differ from house to house. What sort of whole-house filtration would you recommend?

- Are there any other considerations that you think I should keep in mind?

Even for those residents who are privileged to be educated and able to afford water filtration devices, the public water issues we are living with are confounding. The information we receive about our public water supply tends to be fragmented and coming from local public officials who have an interest in downplaying public concerns. In the meantime, it is very difficult to make truly informed decisions about our health.

Thank you in advance for any insights you can share and helping to give my baby a good start in life. I understand if you need to respond as a fellow resident of the world and as experts in general rather than as affiliates of the organizations in which you are employed.

Thank you much,

I agree with Jen's last sentence. I think focusing on what the system and local health department, or TSC-Cincy experts or CDC can do in the short term to assess the extent of the issue and offer remediation options that can be quickly implemented, if needed, is a sound approach.

I am not certain of the regulatory applicability related to previous consecutive systems, which can come to agreement with the parent system about who does what, and how this scenario applies to the former consecutive system for things like installation and maintenance of corrosion control (since the installation was not done by the former consecutive system.) Can we ask HQ if they know of other systems like this, or maybe this has been done already. I am still catching up on email.

Subject: RE: Flint Discussion

Rita--you asked at our July 1 meeting that we provide you with any comments related to your write-up to summarize this situation with Flint, or from our meeting.

I had a discussion with Miguel earlier this week, and it seems more apparent that Flint may have violated the LCR by not maintaining corrosion control after being optimized back in the early

1990's (since they were a customer of Detroit). MDEQ did not tell Flint to maintain corrosion control; instead, they treated the change in source water as a new system. I'll bet that the State will take this personally since they are responsible for the City of Flint's actions; which isn't a bad thing, but they may get VERY defensive. We can get into the weeds and explain in detail the intent of the rule and our interpretation of the rule and why the State must issue a TT violation, but in the end; the City, the State and we must move forward TOGETHER to correct this problem. We have resources in Mike Schock and Darren Lytle and Mike Wright; and we want to work with the State and the City to address ALL of the contaminant issues going on in Flint; bacti, TTHMs, Legionella, lead--from a wholistic approach to get some form of corrosion control working that doesn't minimize treatment for bacti or TTHMs. It doesn't make sense to discuss with the State what happened in the past; we need to move forward and work with the State as our partner; as the State sees the lead levels climbing, I don't see the benefit in rubbing their nose in the fact that we're right, and they're wrong.

If the State/City agree to issue public education on how citizens must properly flush their taps, I'm wondering what the benefit would be to force the State to issue a TT violation to Flint.

Regarding the State's protocol of pre-flushing, Miguel said earlier this week on the phone with me that pre-flushing didn't really make that much difference in the lead levels when the City was using Detroit water, since there was scale existing on the inside of the lead pipes. Now that the scale appears to be disappearing, the lead levels are starting to rise even with pre-flushing being conducted prior to sampling. Yes, the levels would probably be higher without the pre-flushing, but the City may exceed the Action Level even with the pre-flushing. Maybe the issue of the State's use of pre-flushing is moot at this point; perhaps we need to focus our energy on getting the State and City to accept our offer of Darren and Mike's participation in a wholistic approach to starting corrosion control and implementing public education for lead.

Subject: Flint Water question

I am following up on a June 24 memo written by Miguel Del Doral of the EPA's Region 5. In that memo, Mr. Del Toral asserts that a city the size of Flint is required to use a corrosion control treatment such as phosphate in their drinking water.

Is Mr. Del Toral correct?

Also, both Mr. Del Toral, and Marc Edwards, an expert on the issue at Virginia Tech, both say that the manner in which Flint conducts its tests is almost cdertain to minimize the risk and miss worst-case scenarios.

What is the EPA's opinion regarding that?

I can be reached by phone at (w) 313-578-6834 or © Personal Phone / Ex. 6

Subject: RE: ACTION: Flint Water question

Please find below GWDWB's edits to the reporter response. The citation to the Federal SDWA requirements are correct. Please let me know if you have any questions.

CLARIFICATION: **We would like to clarify that the elevated lead levels (13,200 ppb) in the Citizen name / Ex. 6 residence were unique in two ways: 1) the sampled water sat stagnant in the pipes for over 3 weeks (longer stagnation time would be expected to yield higher lead levels), and 2) the long length and configuration of the Citizen name / Ex. 6 service line. Most typical homes in Flint would not have such a configuration or long periods of stagnation time.**

RESPONSES:

Mr. Del Toral asserts that a city the size of Flint is required to use a corrosion control treatment such as phosphate in their drinking water. Is Mr. Del Toral correct?

Generally, large drinking water systems (which is what Flint is) are required to evaluate and optimize corrosion control treatment as necessary. In the case of Flint and their recent (April 30, 2014) transition to a new source of drinking water (Flint River), MDEQ determined that Flint should follow procedures for new systems. This entails two six month monitoring periods to assess whether corrosion control treatment is necessary. The two rounds of sampling in Flint were from July 1, 2014 – December 31, 2014 and January 1, 2015 – June 30, 2015. The water system had until July 10th to submit the sampling results to MDEQ for compliance determination. Once the results of the two 6-month monitoring efforts are evaluated a decision can be made on whether a corrosion control treatment study is needed. If a treatment study is conducted, Flint and MDEQ will work together to determine the level and type of corrosion control treatment needed.

Also, both Mr. Del Toral, and Marc Edwards, an expert on the issue at Virginia Tech, both say that the manner in which Flint conducts its tests is almost certain to minimize the risk and miss worst-case scenarios. What is the EPA's opinion regarding that?

Lead compliance sampling procedures in the state of Michigan comply with Federal SDWA requirements which calls for a minimum of 6 hours during which there is no water used from the tap the sample is taken from. EPA is currently developing the Lead and Copper Long-term Revisions Rule which will address a variety of issues, including sampling protocols.

Thank you, Andrea! I did find a sentence in Miguel's rebuttal to the reporter's comments that states, Citizen name / Ex. 6 service line configuration and long length is also likely not what would be found in most typical homes in Flint." That's what Tinka read yesterday, so I'm going to leave as is. But, I did add your other suggested phrase below in red.

Rita—I thought I'd send this back to Tinka, or maybe you want to forward back to Tinka if you think it's OK—she wanted Miguel's review, but Andrea did a very nice job.

Hi Jennifer,

You did a great job of succinctly answering the questions.

For the "CLARIFICATION" part, I think everyone will agree that having a 3 week stagnation period is atypical, but do we know enough about distribution system configurations in Flint to say that the Citizen name / Ex. 6 long service line is atypical? I think we hope it is, but I'm not sure we know. Also, for this section, do you want to say explicitly that a long stagnation time would be expected to yield higher lead levels?

Thanks,

Andrea Porter

Subject: Slightly revised responses to 2 follow-up questions re: Flint drinking water

Q. Mr. Del Toral asserts that a city the size of Flint is required to use a corrosion control treatment such as phosphate in their drinking water. Is Mr. Del Toral correct?

Flint and other large drinking water systems are required to evaluate and optimize pipe corrosion control treatment to protect water from contaminants such as lead. When the City started sourcing drinking water from the Flint River in April 2014, the Michigan Department of Environmental Quality determined that Flint should follow the protocol for new systems -- which requires two new rounds of water sampling to determine whether corrosion control treatment is needed. The City has submitted sampling results for the six-month periods from July-December 2014, and from January-June 2015. MDEQ is currently analyzing the sampling data to determine whether corrosion control treatment is needed.

Q. Also, both Mr. Del Toral, and Marc Edwards, an expert on the issue at Virginia Tech, both say that the manner in which Flint conducts its tests is almost certain to minimize the risk and miss worst-case scenarios. What is the EPA's opinion regarding that?

Michigan complies with the Federal Safe Drinking Water Act's protocol which requires that the tap remain unused for at least 6 hours before taking a sample. EPA is currently revising the federal lead and copper rule to address several issues including sampling protocols.

In addition, EPA notes that the water samples taken from the Walters' residence were atypical in two ways:

•□□□□□□ the tap had not been run for over three weeks before the samples were taken. Stagnation can cause higher lead levels, and

•□□□□□□ the home’s long service line is configured in an unusual way.

Subject: FW: Flint Water Question from a Pregnant Flint Resident

Tinka, Below is the re-drafted email response to the citizen inquiry. If it is ok, I can send it out myself as written. Otherwise, I can have Miguel re-work it when he gets back.

Ms. [redacted] **Citizen name / Ex. 6**

We are responding to your email of July 11, 2015 to Miguel Del Toral. He is out of the office today, but has provided the following information to your questions. Overall, he agrees with Marc's responses on the water filter. Filters that are certified to remove lead are typically designed to remove 99 percent of the lead. They are also designed with additional capacity as a safety measure, but you should still change the filter in accordance with the manufacturer's instructions. If you identify elevated lead levels from other taps that do not have water filters, we suggest either adding a filter to those, such as the bathroom tap, or only using the filtered tap water for consumption.

If you are still interested in having your water tested you should use a laboratory that has been certified by the State for drinking water analyses (a list is available from the following link: http://www.michigan.gov/deq/0,4561,7-135-3307_4131_4156-36940--,00.html. Please note that a first-draw sample, regardless of pre-flushing, is best for identifying lead that comes from the faucet and other in-home piping or fittings close to the faucet. First-draw sampling does not give a good indication of the lead contribution from sources further from the faucet (i.e. lead service line, leaded brass meter, etc.). Information for residents about first-draw sampling instructions can be found on the last page of the 2006 memo on aerators and LCR sampling at the following link: http://www.epa.gov/ogwdw/lcrmr/pdfs/memo_tapsamples-aerators_10202006.pdf. In addition, below are two graphics from our Region 5 website with information about how to identify if you have a lead service line coming into your home and for faucets that do not have filters on them, how to clean the aerators.

Regarding your TTHM question, EPA has considered developmental and reproductive risks from multiple intake routes of exposure (e.g., ingestion, inhalation, and dermal) in our 2006 Disinfectants and Disinfection Byproducts (DBPR) rule. Some studies did suggest associations between TTHM exposure and various adverse reproductive and development health effects.

However, studies available overall showed inconsistent results. As such, our Agency could not conclude whether exposure to TTHMs could cause adverse reproductive/developmental health effects. However, we did note in our findings that there was the potential for concern.

Currently, we are in the process of re-evaluating our DBPR rules and considering new toxicological data regarding reproductive and developmental health effects. Until our evaluation is complete, pregnant women can elect to take additional precautionary measures such as taking shorter showers, venting the room while showering/bathing, and not ingesting water with high TTHM concentrations.

We hope this information is helpful to you.

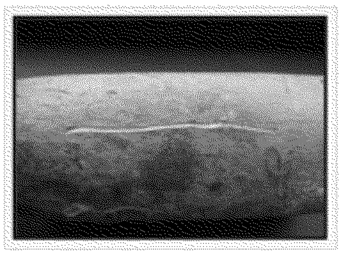
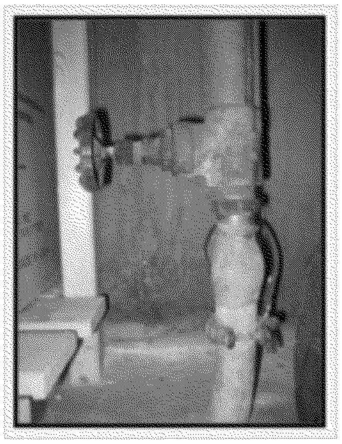
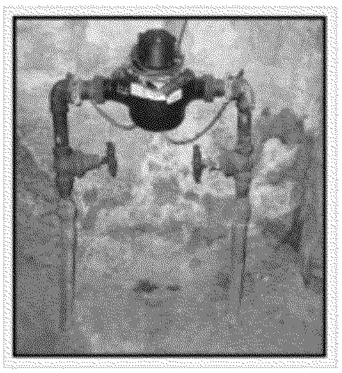
What do lead service lines look like?



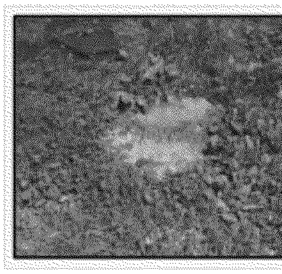
Lead service lines are generally a dull gray color and are very soft. You can identify them easily by carefully scratching with a key. If the pipe is made of lead, the area you've scratched will turn a bright silver color. Do not use a knife or other sharp instrument and take care not to puncture a hole in the pipe.



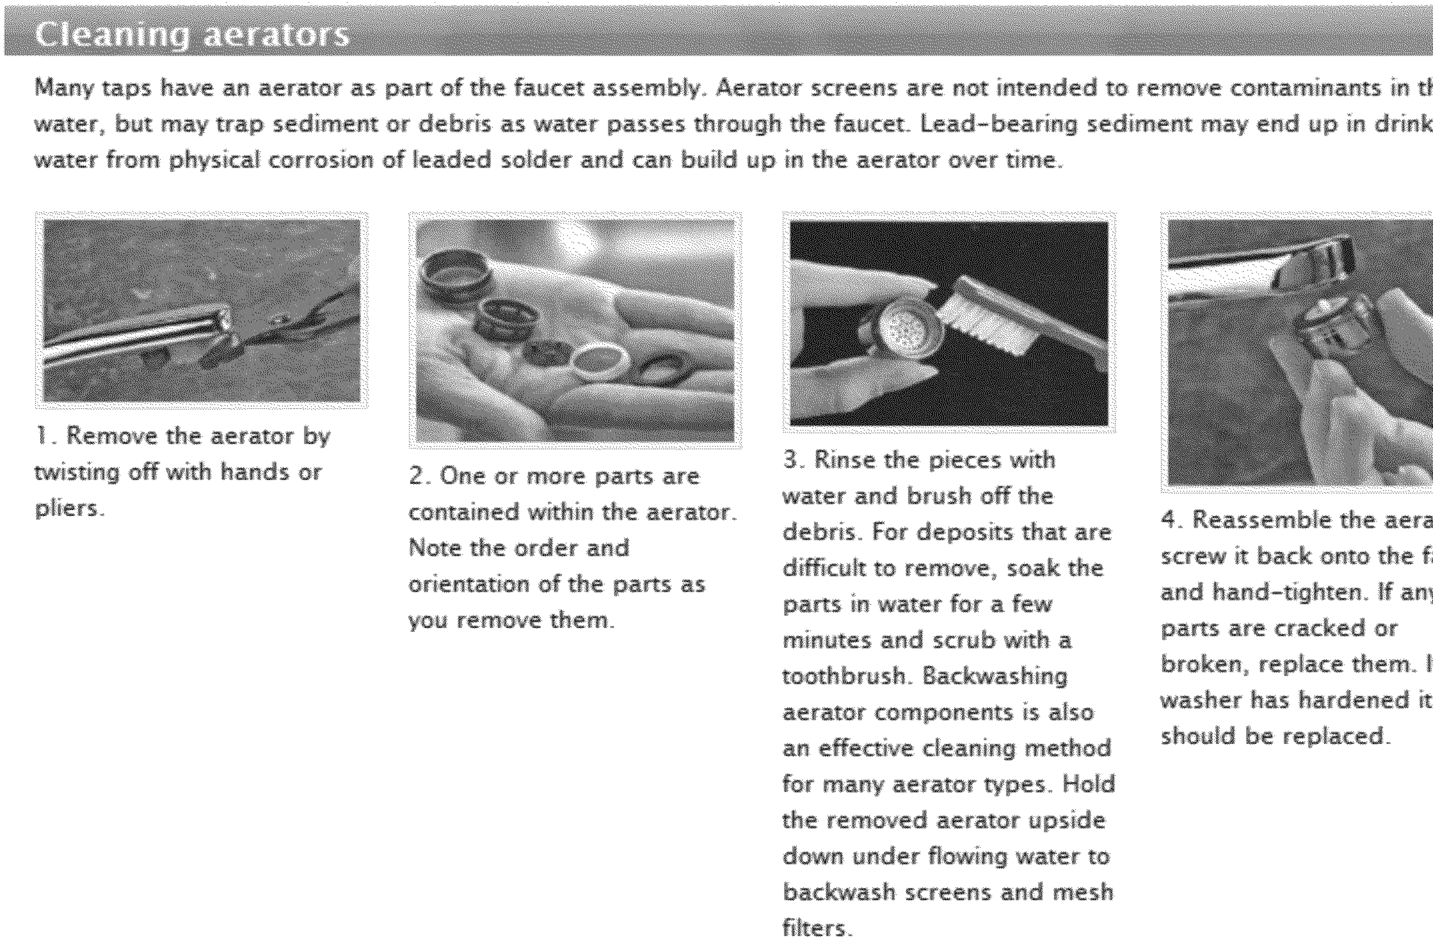
Lead service lines can be connected to the residential plumbing using solder and have a characteristic solder "bulb" at the end, a compression fitting, or other connector made of galvanized iron or brass/bronze.



Lead service lines often end just inside the front or side wall of the home, but may extend further into the building as shown, where the lead service line comes out of the basement floor to the water meter and then back into the floor, continuing further into the building.



If your home has a wate
meter, your water meter
may be in your home or
"meter pit" or "meter vau
as shown above.



Cleaning aerators

Many taps have an aerator as part of the faucet assembly. Aerator screens are not intended to remove contaminants in t
water, but may trap sediment or debris as water passes through the faucet. Lead-bearing sediment may end up in drink
water from physical corrosion of leaded solder and can build up in the aerator over time.

1. Remove the aerator by twisting off with hands or pliers.

2. One or more parts are contained within the aerator. Note the order and orientation of the parts as you remove them.

3. Rinse the pieces with water and brush off the debris. For deposits that are difficult to remove, soak the parts in water for a few minutes and scrub with a toothbrush. Backwashing aerator components is also an effective cleaning method for many aerator types. Hold the removed aerator upside down under flowing water to backwash screens and mesh filters.

4. Reassemble the aera
screw it back onto the f
and hand-tighten. If an
parts are cracked or
broken, replace them. I
washer has hardened it
should be replaced.

Subject: Flint Water Question from a Pregnant Flint Resident

Dear Dr. Edwards and Dr. Del Toral,

Thank you for the work you have already done in my city to protect families from water contaminant exposure. I am a Flint resident, pregnant with my first child, and therefore advised to drink a whopping 10-16 cups of water each day. I am writing to see if you can shed some light or point me to another source for answers regarding water testing and the safest option for staying hydrated.

If your wife or sister or friend were living in Flint and pregnant, what course of action would you recommend she take? Here is my situation:

- A little background: Prior to becoming pregnant, I installed a pur advanced water filter on our kitchen faucet and always use it when drinking from the tap, which I do frequently. (According to the pur website, the filter is said to filter out 70+ chemicals. Recently, I contacted the company to request more information on exactly what chemicals are filtered and up to what level, and am awaiting their reply.) When using the filter, the water is crystal clear, free of the river smell and without the slight yellow tinge that we sometimes have coming out of the tap (unlike in our bathroom sink which I use to brush my teeth...). I was compelled to purchase the filter because my legs began to swell after Flint changed to the river water, and after installing the filter this problem went away. I even tested the difference by drinking filtered water some days (consistently no swelling) and and unfiltered water others (consistent swelling) for a week or two. I understand the swelling to be the result of sodium chloride in our water which is corrosive enough to make GM stop using Flint water in their local plant (http://www.mlive.com/news/flint/index.ssf/2014/10/general_motors_wont_use_flint.html)

- Given your findings of high levels of lead in some residents' water, my husband strongly believes that I should cease drinking all Flint water and drink bottled water instead. However, I have read extensively about safety concerns of plastic-bottled water (chemists who work with plastics avoid drinking it) and this does not seem to be a safer option despite frequent bottled water drives organized by well-meaning activists across Flint.

- I would like to test our house's tap water with and without the kitchen filter using an independent lab, but my husband thinks this will be a futile effort because we have no reliable way of knowing if the results on one day will be consistent with results on other days, such as if the City of Flint were doing some special change to the water treatment procedure. Would testing multiple times across several weeks be sufficient to address this possibility? If so, how many times and at what interval would you recommend testing, and can you recommend a testing lab? If a high level of lead is discovered, who should we contact to determine where the lead is coming from as a next step?

- According to the consultant that Erin Brockovich sent to Flint earlier this year (http://www.mlive.com/news/flint/index.ssf/2015/02/tthm_how_worried_should_flint.html), total trihalomethanes (TTHM) in the water are dangerous to pregnant women through inhalation exposure during hot showers. (And pregnant women tend to appreciate long, hot showers because our backs are constantly aching!) At this point, the lead issues seem more frightening, though we are considering investing in a costly whole-house water filtration system to deal with both. How can we determine the relative risk to pregnant women for lead in the water vs. TTHMs? I suppose that could differ from house to house. What sort of whole-house filtration would you recommend?

- Are there any other considerations that you think I should keep in mind?

Even for those residents who are privileged to be educated and able to afford water filtration devices, the public water issues we are living with are confounding. The information we receive about our public water supply tends to be fragmented and coming from local public officials who have an interest in downplaying public concerns. In the meantime, it is very difficult to make truly informed decisions about our health.

Thank you in advance for any insights you can share and helping to give my baby a good start in life. I understand if you need to respond as a fellow resident of the world and as experts in general rather than as affiliates of the organizations in which you are employed.

Thank you much,

Thanks. Overall this looks good. What is the answer to a potential follow-up question related to how to draw a sample to test for lead contributions from other sources? I know that gets complicated and may require knowledge of the length of the Pb service line or sequential sampling that can get rather expensive. Do we have a protocol available for residents on this?

Subject: Flint Water Question from a Pregnant Flint Resident

Dear Dr. Edwards and Dr. Del Toral,

Thank you for the work you have already done in my city to protect families from water contaminant exposure. I am a Flint resident, pregnant with my first child, and therefore advised to drink a whopping 10-16 cups of water each day. I am writing to see if you can shed some light or point me to another source for answers regarding water testing and the safest option for staying hydrated.

If your wife or sister or friend were living in Flint and pregnant, what course of action would you recommend she take? Here is my situation:

- A little background: Prior to becoming pregnant, I installed a pur advanced water filter on our kitchen faucet and always use it when drinking from the tap, which I do frequently. (According to the pur website, the filter is said to filter out 70+ chemicals. Recently, I contacted the company to request more information on exactly what chemicals are filtered and up to what level, and am awaiting their reply.) When using the filter, the water is crystal clear, free of the river smell and without the slight yellow tinge that we sometimes have coming out of the tap (unlike in our bathroom sink which I use to brush my teeth...). I was compelled to purchase the filter because my legs began to swell after Flint changed to the river water, and after installing the filter this problem went away. I even tested the difference by drinking filtered water some days (consistently no swelling) and and unfiltered water others (consistent swelling) for a week or two. I understand the swelling to be the result of sodium chloride in our water which is corrosive enough to make GM stop using Flint water in their local plant (http://www.mlive.com/news/flint/index.ssf/2014/10/general_motors_wont_use_flint.html)

- Given your findings of high levels of lead in some residents' water, my husband strongly believes that I should cease drinking all Flint water and drink bottled water instead. However, I have read extensively about safety concerns of plastic-bottled water (chemists who work with plastics avoid drinking it) and this does not seem to be a safer option despite frequent bottled water drives organized by well-meaning activists across Flint.

- I would like to test our house's tap water with and without the kitchen filter using an independent lab, but my husband thinks this will be a futile effort because we have no reliable way of knowing if the results on one day will be consistent with results on other days, such as if the City of Flint were doing some special change to the water treatment procedure. Would testing multiple times across several weeks be sufficient to address this possibility? If so, how many times and at what interval would you recommend testing, and can you recommend a testing lab? If a high level of lead is discovered, who should we contact to determine where the lead is coming from as a next step?

- According to the consultant that Erin Brockovich sent to Flint earlier this year (http://www.mlive.com/news/flint/index.ssf/2015/02/tthm_how_worried_should_flint.html), total trihalomethanes (TTHM) in the water are dangerous to pregnant women through inhalation exposure during hot showers. (And pregnant women tend to appreciate long, hot showers because our backs are constantly aching!) At this point, the lead issues seem more frightening, though we are considering investing in a costly whole-house water filtration system to deal with both. How can we determine the relative risk to pregnant women for lead in the water vs. TTHMs? I suppose that could differ from house to house. What sort of whole-house filtration would you recommend?

- Are there any other considerations that you think I should keep in mind?

Even for those residents who are privileged to be educated and able to afford water filtration devices, the public water issues we are living with are confounding. The information we receive about our public water supply tends to be fragmented and coming from local public officials who have an interest in downplaying public concerns. In the meantime, it is very difficult to make truly informed decisions about our health.

Thank you in advance for any insights you can share and helping to give my baby a good start in life. I understand if you need to respond as a fellow resident of the world and as experts in general rather than as affiliates of the organizations in which you are employed.

Thank you much,

Andrea told me we do not have a protocol for this other than the Chicago study protocol which I did not think we wanted to send. I understood Miguel's response to say that to find those other sources would require sequential sampling which was expensive and not necessary since they already have the water filter.

Thanks. Overall this looks good. What is the answer to a potential follow-up question related to how to draw a sample to test for lead contributions from other sources? I know that gets complicated and may require knowledge of the length of the Pb service line or sequential sampling that can get rather expensive. Do we have a protocol available for residents on this?

Tinka, Below is the re-drafted email response to the citizen inquiry. If it is ok, I can send it out myself as written. Otherwise, I can have Miguel re-work it when he gets back.

Ms. **Citizen name / Ex. 6**

We are responding to your email of July 11, 2015 to Miguel Del Toral. He is out of the office today, but has provided the following information to your questions. Overall, he agrees with

Marc's responses on the water filter. Filters that are certified to remove lead are typically designed to remove 99 percent of the lead. They are also designed with additional capacity as a safety measure, but you should still change the filter in accordance with the manufacturer's instructions. If you identify elevated lead levels from other taps that do not have water filters, we suggest either adding a filter to those, such as the bathroom tap, or only using the filtered tap water for consumption.

If you are still interested in having your water tested you should use a laboratory that has been certified by the State for drinking water analyses (a list is available from the following link: http://www.michigan.gov/deq/0,4561,7-135-3307_4131_4156-36940--,00.html. Please note that a first-draw sample, regardless of pre-flushing, is best for identifying lead that comes from the faucet and other in-home piping or fittings close to the faucet. First-draw sampling does not give a good indication of the lead contribution from sources further from the faucet (i.e. lead service line, leaded brass meter, etc.). Information for residents about first-draw sampling instructions can be found on the last page of the 2006 memo on aerators and LCR sampling at the following link: http://www.epa.gov/ogwdw/lcrmr/pdfs/memo_tapsamples-aerators_10202006.pdf. In addition, below are two graphics from our Region 5 website with information about how to identify if you have a lead service line coming into your home and for faucets that do not have filters on them, how to clean the aerators.

Regarding your TTHM question, EPA has considered developmental and reproductive risks from multiple intake routes of exposure (e.g., ingestion, inhalation, and dermal) in our 2006 Disinfectants and Disinfection Byproducts (DBPR) rule. Some studies did suggest associations between TTHM exposure and various adverse reproductive and development health effects. However, studies available overall showed inconsistent results. As such, our Agency could not conclude whether exposure to TTHMs could cause adverse reproductive/developmental health effects. However, we did note in our findings that there was the potential for concern.

Currently, we are in the process of re-evaluating our DBPR rules and considering new toxicological data regarding reproductive and developmental health effects. Until our evaluation is complete, pregnant women can elect to take additional precautionary measures such as taking shorter showers, venting the room while showering/bathing, and not ingesting water with high TTHM concentrations.

We hope this information is helpful to you.

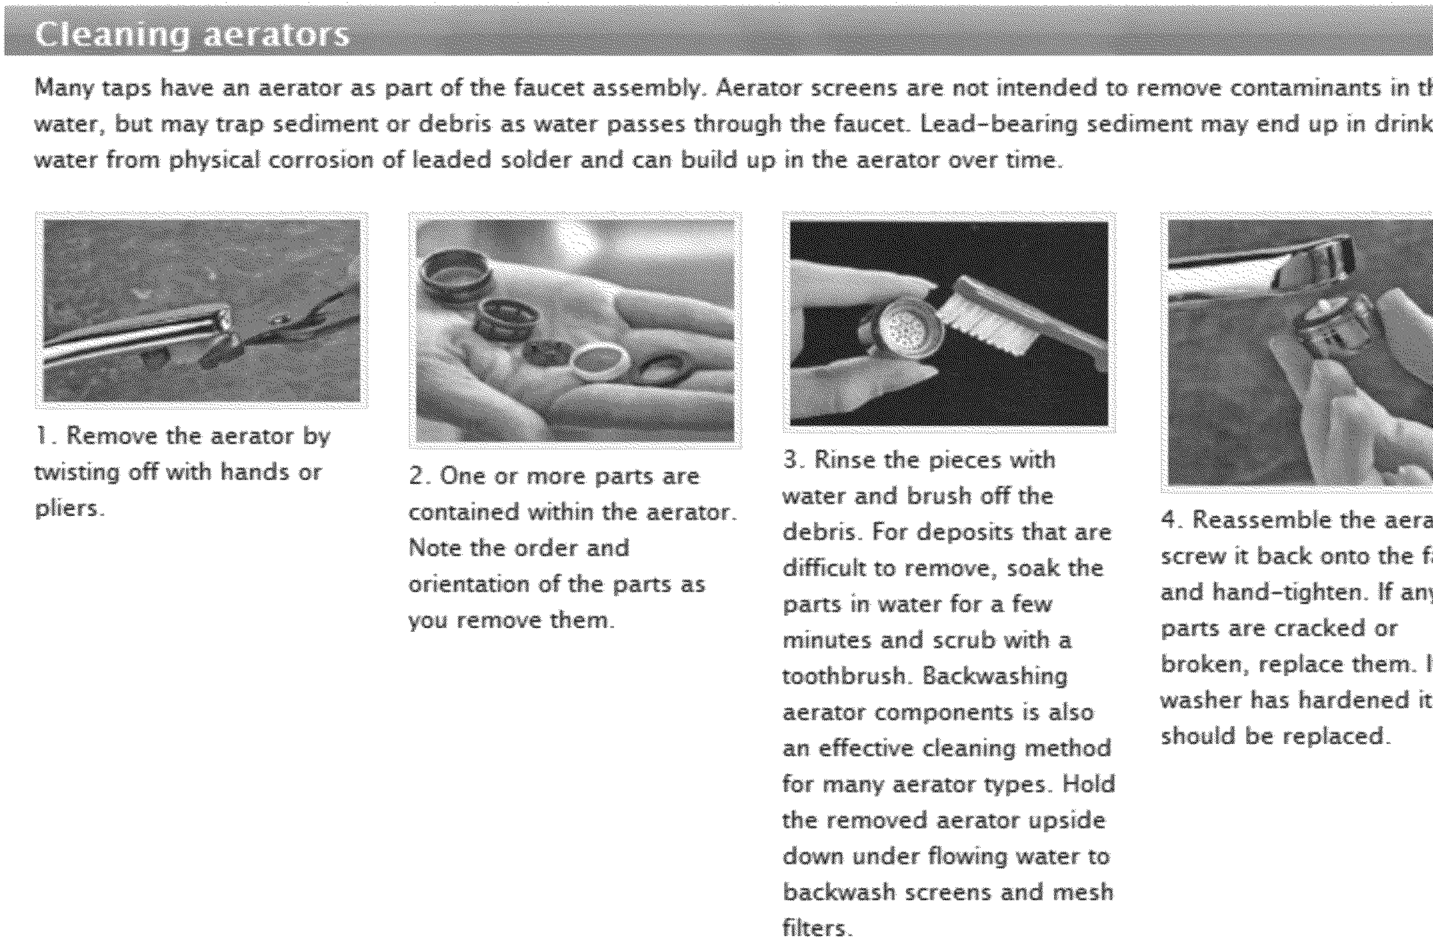
What do lead service lines look like?

Lead service lines are generally a dull gray color and are very soft. You can identify them easily by carefully scratching with a key. If the pipe is made of lead, the area you've scratched will turn a bright silver color. Do not use a knife or other sharp instrument and take care not to puncture a hole in the pipe.

Lead service lines can be connected to the residential plumbing using solder and have a characteristic solder "bulb" at the end, a compression fitting, or other connector made of galvanized iron or brass/bronze.

Lead service lines often end just inside the front or side wall of the home, but may extend further into the building as shown, where the lead service line comes out of the basement floor to the water meter and then back into the floor, continuing further into the building.

If your home has a wate
meter, your water mete
may be in your home or
"meter pit" or "meter va
as shown above.



Cleaning aerators

Many taps have an aerator as part of the faucet assembly. Aerator screens are not intended to remove contaminants in th water, but may trap sediment or debris as water passes through the faucet. Lead-bearing sediment may end up in drink water from physical corrosion of leaded solder and can build up in the aerator over time.

1. Remove the aerator by twisting off with hands or pliers.

2. One or more parts are contained within the aerator. Note the order and orientation of the parts as you remove them.

3. Rinse the pieces with water and brush off the debris. For deposits that are difficult to remove, soak the parts in water for a few minutes and scrub with a toothbrush. Backwashing aerator components is also an effective cleaning method for many aerator types. Hold the removed aerator upside down under flowing water to backwash screens and mesh filters.

4. Reassemble the aera screw it back onto the f and hand-tighten. If any parts are cracked or broken, replace them. I washer has hardened it should be replaced.

Subject: Slightly revised responses to 2 follow-up questions re: Flint drinking water

Q. Mr. Del Toral asserts that a city the size of Flint is required to use a corrosion control treatment such as phosphate in their drinking water. Is Mr. Del Toral correct?

Flint and other large drinking water systems are required to evaluate and optimize pipe corrosion control treatment to protect water from contaminants such as lead. When the City started sourcing drinking water from the Flint River in April 2014, the Michigan Department of Environmental Quality determined that Flint should follow the protocol for new systems -- which requires two new rounds of water sampling to determine whether corrosion control treatment is needed. The City has submitted sampling results for the six-month periods from July-December 2014, and from January-June 2015. MDEQ is currently analyzing the sampling data to determine whether corrosion control treatment is needed.

Q. Also, both Mr. Del Toral, and Marc Edwards, an expert on the issue at Virginia Tech, both say that the manner in which Flint conducts its tests is almost certain to minimize the risk and miss worst-case scenarios. What is the EPA's opinion regarding that?

Michigan complies with the Federal Safe Drinking Water Act's protocol which requires that the tap remain unused for at least 6 hours before taking a sample. EPA is currently revising the federal lead and copper rule to address several issues including sampling protocols.

In addition, EPA notes that the water samples taken from the Walters' residence were atypical in two ways:

•□□□□□□ the tap had not been run for over three weeks before the samples were taken. Stagnation can cause higher lead levels, and

•□□□□□□ the home's long service line is configured in an unusual way.

Subject: Re: Flint Discussion

I very much disagree with not issuing a TT violation here. If you open this door for Flint (i.e., new source = new system), other systems elsewhere inside/outside R5 are going to want the same treatment. I am copying Ed Moriarty on this as I think we need an OGWDW/OGC review if we are considering NOT issuing a TT violation for failure to install/maintain OCCT as it will set a very bad precedent and could cause problems in other R5 states and regions.

The advanced notification and approval requirements in the LCR for long-term treatment changes and new sources were intended to make systems think about these source water and treatment transitions carefully so that they plan the transition accordingly and don't increase lead/copper levels.

I know it's a tough situation, and I agree that our primary focus should be on moving forward, but at a minimum we need to have a discussion with OGWDW and OGC on this.

I agree with Jen's last sentence. I think focusing on what the system and local health department, or TSC-Cincy experts or CDC can do in the short term to assess the extent of the issue and offer remediation options that can be quickly implemented, if needed, is a sound approach.

I am not certain of the regulatory applicability related to previous consecutive systems, which can come to agreement with the parent system about who does what, and how this scenario applies to the former consecutive system for things like installation and maintenance of corrosion control (since the installation was not done by the former consecutive system.) Can we ask HQ if they know of other systems like this, or maybe this has been done already. I am still catching up on email.

Subject: RE: Flint Discussion

Rita—you asked at our July 1 meeting that we provide you with any comments related to your write-up to summarize this situation with Flint, or from our meeting.

I had a discussion with Miguel earlier this week, and it seems more apparent that Flint may have violated the LCR by not maintaining corrosion control after being optimized back in the early 1990's (since they were a customer of Detroit). MDEQ did not tell Flint to maintain corrosion control; instead, they treated the change in source water as a new system. I'll bet that the State will take this personally since they are responsible for the City of Flint's actions; which isn't a bad thing, but they may get VERY defensive. We can get into the weeds and explain in detail the intent of the rule and our interpretation of the rule and why the State must issue a TT violation, but in the end; the City, the State and we must move forward TOGETHER to correct this problem. We have resources in Mike Schock and Darren Lytle and Mike Wright; and we want to work with the State and the City to address ALL of the contaminant issues going on in Flint; bacti, TTHMs, Legionella, lead—from a wholistic approach to get some form of corrosion control working that doesn't minimize treatment for bacti or TTHMs. It doesn't make sense to discuss with the State what happened in the past; we need to move forward and work with the State as our partner; as the State sees the lead levels climbing, I don't see the benefit in rubbing their nose in the fact that we're right, and they're wrong.

If the State/City agree to issue public education on how citizens must properly flush their taps, I'm wondering what the benefit would be to force the State to issue a TT violation to Flint.

Regarding the State's protocol of pre-flushing, Miguel said earlier this week on the phone with me that pre-flushing didn't really make that much difference in the lead levels when the City was using Detroit water, since there was scale existing on the inside of the lead pipes. Now that the scale appears to be disappearing, the lead levels are starting to rise even with pre-flushing being conducted prior to sampling. Yes, the levels would probably be higher without the pre-flushing, but the City may exceed the Action Level even with the pre-flushing. Maybe the issue of the State's use of pre-flushing is moot at this point; perhaps we need to focus our energy on getting the State and City to accept our offer of Darren and Mike's participation in a wholistic approach to starting corrosion control and implementing public education for lead.

I have been trying to wrap by brain around all the Flint issues and developed the attached summary that I thought I'd share for the meeting. Our objective for the meeting is to discuss the status of Flint, what are all the current issues are, and to all agree on next steps and messaging. If you have other objectives for the meeting please bring those up first thing at the meeting.

Subject: Re: Flint Discussion

Rita/Nick/Tom – I thought we had decided to postpone the discussion on compliance until later so that I could focus on getting the final report done. As with inaccurate information that was going to MDEQ, I am now seeing back and forth from GWDWB folks on the compliance issues that is not consistent with the LCR. No disrespect intended, but I worked on the LCR and I know the intent of these provisions (see final rule and guidance excerpts below). GWDWB folks jumping into this discussion without knowing the LCR requirements/intent or reading the rule, preamble and guidance is not helpful and is taking away the little time I have to work on the report.

My recommendation is that this compliance discussion be postponed into next week when Nick and Tom are back in the office and we can schedule a call with OGWDW so that everyone is in on the discussion. Please advise.

LCR Short-term Revisions (2007) Preamble (beginning on page 57788)

2. What Is EPA's Rationale for Advanced Notification and Approval of Long-Term Treatment Changes or Addition of New Source Revisions?

***

EPA requested comment on whether it should revise the existing rule language on "addition of new source" to "source change," but did not propose to make this change. Many commenters stated that revising the rule to cover any source change would be too prescriptive and that this could also include daily changes. Source changes occur on a daily basis due to changes in demand and commenters expressed concern that State review and approval of these changes could not be done in a timely manner and therefore could be detrimental to public health. EPA has retained the language of "addition of new source" in the final rule rather than use the term "source change." EPA believes that it would be difficult to define a long-term source change because the source mixture can constantly change due to demand or changes in availability of sources. EPA discussed several scenarios in the proposed rule, including switching from 100% surface water to 100% ground water, switching from 100% surface water to 50% ground water and 50% surface water, and a change in proportion of moving from 75% ground water and 25% surface water to 25% ground water and 75% surface water.

EPA believes that the existing language "addition of new source" covers the first two scenarios. Notification and approval would not be necessary if the switch is repeated on an annual basis.

The optimal corrosion control treatment for systems with mixed sources (ground water and surface water) should consider the impact of changing the proportions. Section 141.87(a)(1)(i) states that the tap samples shall be representative of water quality throughout the distribution system taking into account the number of persons, the different sources of water, the different treatment methods employed by the system, and seasonal variability. Both water source and water treatment methods can produce different finished water pH values or other critical water quality parameters. For example, if the finished water pH values from both the surface sources and ground water sources are very similar, then this can mitigate the impact of changing the proportions of the various sources. Systems with waters that have different finished pH values should consider monitoring at the representative sites in the distribution system after making a major change in the proportions of the sources (75% ground water to 25% ground water). EPA will provide guidance to help systems identify source water changes (such as changing the mixture) that could impact optimal corrosion control.

Some commenters stated that State approval of the treatment change or addition of a new source is not necessary and would delay changes needed by the system. EPA disagrees with these commenters. EPA believes that clarifying the revision to focus on long-term treatment changes will address concerns that this requirement would affect a system's ability to address daily water quality treatment changes. State notification and approval of long-term treatment changes is important because these changes could adversely impact optimal corrosion control. As EPA noted in the proposed rule, this approach allows the State to evaluate the change prior to implementation and, if needed, to design a monitoring program to ensure that optimal corrosion control is maintained after the change. EPA expects that States will review and approve long-term treatment changes and additions of new sources expeditiously and will avoid unnecessary delays to long-term changes that are needed by the system.

EPA's intent is also re-stated in Section E of the attached LCR Short-term Revisions State Guidance – pages 24 & 25).

Subject: RE: Flint Discussion

I agree with Jen's last sentence. I think focusing on what the system and local health department, or TSC-Cincy experts or CDC can do in the short term to assess the extent of the issue and offer remediation options that can be quickly implemented, if needed, is a sound approach.

I am not certain of the regulatory applicability related to previous consecutive systems, which can come to agreement with the parent system about who does what, and how this scenario applies to the former consecutive system for things like installation and maintenance of corrosion control (since the installation was not done by the former consecutive system.) Can we ask HQ if they know of other systems like this, or maybe this has been done already. I am still catching up on email.

Subject: RE: Flint Discussion

I agree with Jen's last sentence. I think focusing on what the system and local health department, or TSC-Cincy experts or CDC can do in the short term to assess the extent of the issue and offer remediation options that can be quickly implemented, if needed, is a sound approach.

I am not certain of the regulatory applicability related to previous consecutive systems, which can come to agreement with the parent system about who does what, and how this scenario applies to the former consecutive system for things like installation and maintenance of corrosion control (since the installation was not done by the former consecutive system.) Can we ask HQ if they know of other systems like this, or maybe this has been done already. I am still catching up on email.

Thanks,

Janet Kuefler

Rita—you asked at our July 1 meeting that we provide you with any comments related to your write-up to summarize this situation with Flint, or from our meeting.

Attorney Client / Ex. 5 Enforcement/Investigatory / Ex. 7A

Attorney Client / Ex. 5 Enforcement/Investigatory / Ex. 7A MDEQ did not tell Flint to maintain corrosion control; instead, they treated the change in source water as a new system. I'll bet that the State will take this personally since they are responsible for the City of Flint's actions; which isn't a bad thing, but they may get VERY defensive. We can get into the weeds and explain in detail the intent of the rule and our interpretation of the rule **Attorney Client / Ex. 5 Enforcement/Investigatory / Ex. 7A** [redacted] but in the end; the City, the State and we must move forward TOGETHER to correct this problem. We have resources in Mike Schock and Darren Lytle and Mike Wright; and we want to work with the State and the City to address ALL of the contaminant issues going on in Flint; bacti, TTHMs, Legionella, lead—from a wholistic approach to get some form of corrosion control working that doesn't minimize treatment for bacti or TTHMs. It doesn't make sense to discuss with the State what happened in the past; we need to move forward and work with the State as our partner; as the State sees the lead levels climbing, I don't see the benefit in rubbing their nose in the fact that we're right, and they're wrong.

If the State/City agree to issue public education on how citizens must properly flush their taps, **Enforcement/Investigatory / Ex. 7A**

Regarding the State's protocol of pre-flushing, Miguel said earlier this week on the phone with me that pre-flushing didn't really make that much difference in the lead levels when the City was using Detroit water, since there was scale existing on the inside of the lead pipes. Now that the scale appears to be disappearing, the lead levels are starting to rise even with pre-flushing being conducted prior to sampling. Yes, the levels would probably be higher without the pre-flushing, but the City may exceed the Action Level even with the pre-flushing. Maybe the issue of the State's use of pre-flushing is moot at this point; perhaps we need to focus our energy on getting the State and City to accept our offer of Darren and Mike's participation in a wholistic approach to starting corrosion control and implementing public education for lead.

On Jul 14, 2015 5:22 PM, "Bair, Rita" <bair.rita@epa.gov> wrote:

> We are responding to your email of July 11, 2015 to Miguel Del Toral. He is out of the office today, but has provided the following information to your lead questions. Overall, he agrees with Marc's responses on the water filter. Filters that are certified to remove lead are typically designed to remove 99 percent of the lead. They are also designed with additional capacity as a safety measure, but you should still change the filter in accordance with the manufacturer's instructions. If you identify elevated lead levels from other taps that do not have water filters, we suggest either adding a filter to those, such as the bathroom tap, or only using the filtered tap water for consumption.
>
> If you are still interested in having your water tested you should use a laboratory that has been certified by the State for drinking water analyses (a list is available from the following link: http://www.michigan.gov/deq/0,4561,7-135-3307_4131_4156-36940--,00.html. Please note that a first-draw sample, regardless of pre-flushing, is best for identifying lead that comes from the faucet and other in-home piping or fittings close to the faucet. First-draw sampling does not give a good indication of the lead contribution from sources further from the faucet (i.e. lead service line, leaded brass meter, etc.). Information for residents about first-draw sampling instructions can be found on the last page of the 2006 memo on aerators and LCR sampling at the following link: http://www.epa.gov/ogwdw/lcrmr/pdfs/memo_tapsamples-aerators_10202006.pdf. In addition, below are two graphics from our Region 5 website with information about how to identify if you have a lead service line coming into your home and for faucets that do not have filters on them, how to clean the aerators.
>
> Regarding your TTHM question, EPA has considered developmental and reproductive risks from multiple intake routes of exposure (e.g., ingestion, inhalation, and dermal) in our 2006 Disinfectants and Disinfection Byproducts (DBPR) rule. Some studies did suggest associations between TTHM exposure and various adverse reproductive and development

health effects. However, studies available overall showed inconsistent results. As such, our Agency could not conclude whether exposure to TTHMs could cause adverse reproductive/developmental health effects. However, we did note in our findings that there was the potential for concern.

Currently, we are in the process of re-evaluating our DBPR rules and considering new toxicological data regarding reproductive and developmental health effects. Until our evaluation is complete, pregnant women can elect to take additional precautionary measures such as taking shorter showers, venting the room while showering/bathing, and not ingesting water with high TTHM concentrations.

We hope this information is helpful to you.

Rita D. Bair

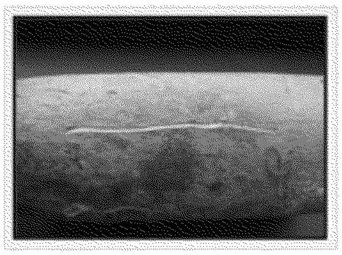
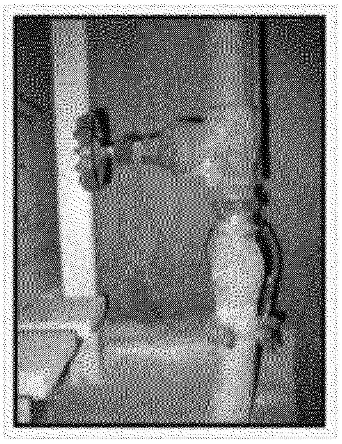
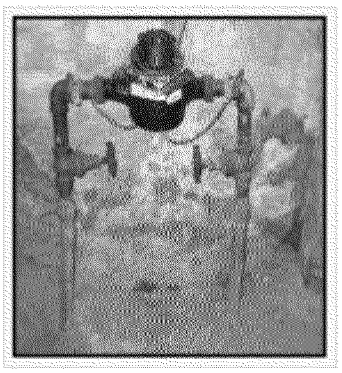
What do lead service lines look like?



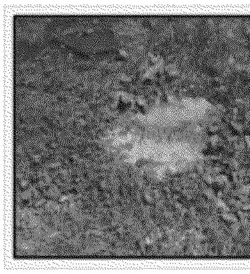
Lead service lines are generally a dull gray color and are very soft. You can identify them easily by carefully scratching with a key. If the pipe is made of lead, the area you've scratched will turn a bright silver color. Do not use a knife or other sharp instrument and take care not to puncture a hole in the pipe.



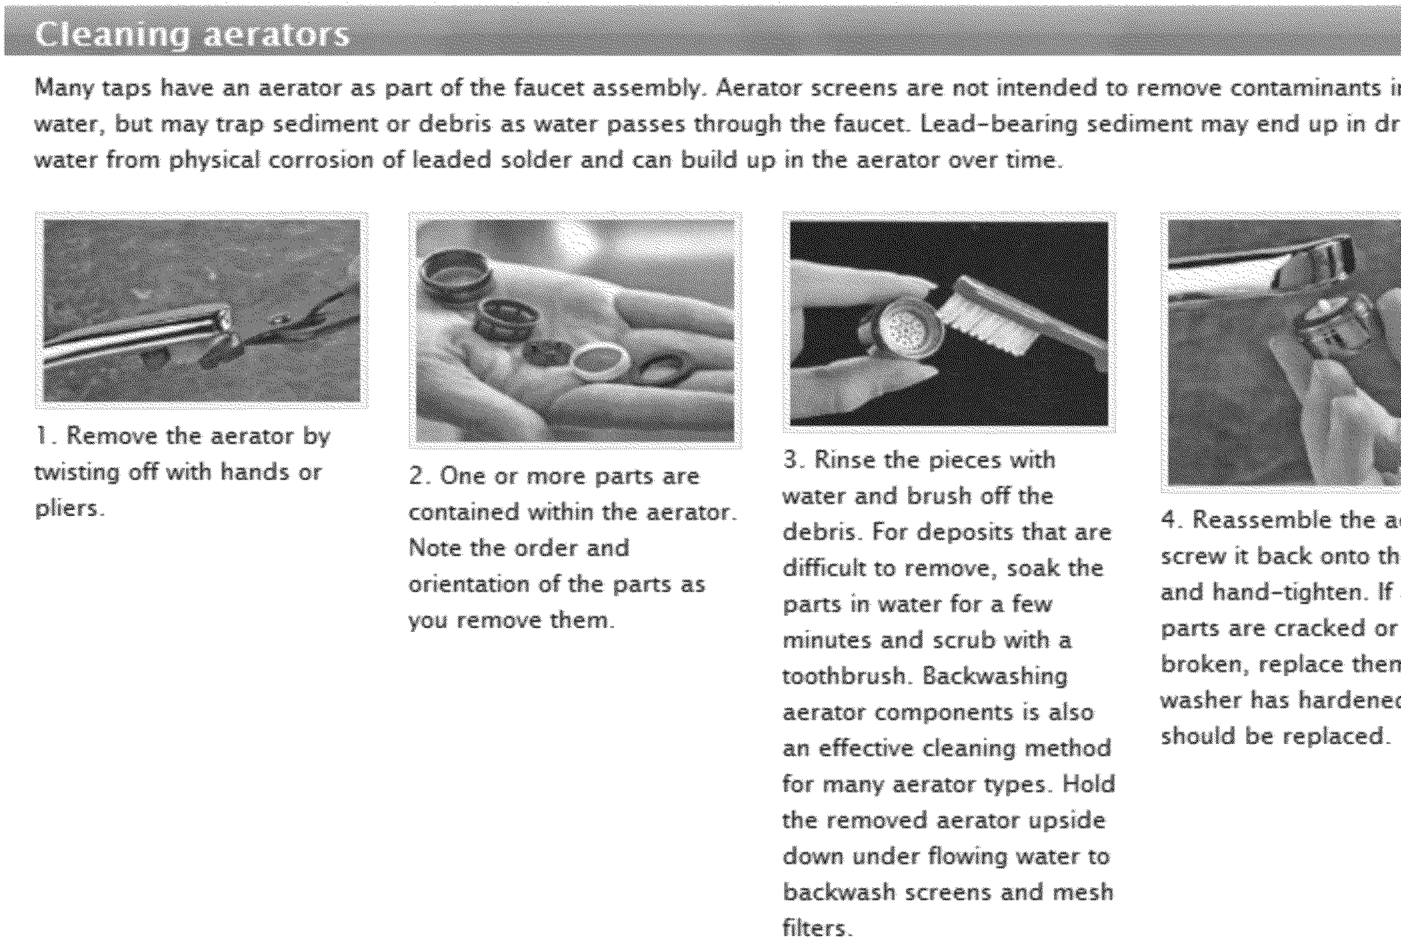
Lead service lines can be connected to the residential plumbing using solder and have a characteristic solder "bulb" at the end, a compression fitting, or other connector made of galvanized iron or brass/bronze.



Lead service lines often end just inside the front or side wall of the home, but may extend further into the building as shown, where the lead service line comes out of the basement floor to the water meter and then back into the floor, continuing further into the building.



If your home has a wa
meter, your water me
may be in your home
"meter pit" or "meter
as shown above.



Cleaning aerators

Many taps have an aerator as part of the faucet assembly. Aerator screens are not intended to remove contaminants i
water, but may trap sediment or debris as water passes through the faucet. Lead-bearing sediment may end up in dr
water from physical corrosion of leaded solder and can build up in the aerator over time.

1. Remove the aerator by twisting off with hands or pliers.

2. One or more parts are contained within the aerator. Note the order and orientation of the parts as you remove them.

3. Rinse the pieces with water and brush off the debris. For deposits that are difficult to remove, soak the parts in water for a few minutes and scrub with a toothbrush. Backwashing aerator components is also an effective cleaning method for many aerator types. Hold the removed aerator upside down under flowing water to backwash screens and mesh filters.

4. Reassemble the a
screw it back onto th
and hand-tighten. If
parts are cracked or
broken, replace the
washer has hardene
should be replaced.

Subject: Flint Water Question from a Pregnant Flint Resident

Dear Dr. Edwards and Dr. Del Toral,

Thank you for the work you have already done in my city to protect families from water contaminant exposure. I am a Flint resident, pregnant with my first child, and therefore advised to drink a whopping 10-16 cups of water each day. I am writing to see if you can shed some light or point me to another source for answers regarding water testing and the safest option for staying hydrated.

If your wife or sister or friend were living in Flint and pregnant, what course of action would you recommend she take? Here is my situation:

- A little background: Prior to becoming pregnant, I installed a pur advanced water filter on our kitchen faucet and always use it when drinking from the tap, which I do frequently. (According to the pur website, the filter is said to filter out 70+ chemicals. Recently, I contacted the company to request more information on exactly what chemicals are filtered and up to what level, and am awaiting their reply.) When using the filter, the water is crystal clear, free of the river smell and without the slight yellow tinge that we sometimes have coming out of the tap (unlike in our bathroom sink which I use to brush my teeth...). I was compelled to purchase the filter because my legs began to swell after Flint changed to the river water, and after installing the filter this problem went away. I even tested the difference by drinking filtered water some days (consistently no swelling) and and unfiltered water others (consistent swelling) for a week or two. I understand the swelling to be the result of sodium chloride in our water which is corrosive enough to make GM stop using Flint water in their local plant (http://www.mlive.com/news/flint/index.ssf/2014/10/general_motors_wont_use_flint.html)

- Given your findings of high levels of lead in some residents' water, my husband strongly believes that I should cease drinking all Flint water and drink bottled water instead. However, I have read extensively about safety concerns of plastic-bottled water (chemists who work with plastics avoid drinking it) and this does not seem to be a safer option despite frequent bottled water drives organized by well-meaning activists across Flint.

- I would like to test our house's tap water with and without the kitchen filter using an independent lab, but my husband thinks this will be a futile effort because we have no reliable way of knowing if the results on one day will be consistent with results on other days, such as if the City of Flint were doing some special change to the water treatment procedure. Would testing multiple times across several weeks be sufficient to address this possibility? If so, how many times and at what interval would you recommend testing, and can you recommend a testing lab? If a high level of lead is discovered, who should we contact to determine where the lead is coming from as a next step?

- According to the consultant that Erin Brockovich sent to Flint earlier this year (http://www.mlive.com/news/flint/index.ssf/2015/02/tthm_how_worried_should_flint.html), total trihalomethanes (TTHM) in the water are dangerous to pregnant women through inhalation exposure during hot showers. (And pregnant women tend to appreciate long, hot showers because our backs are constantly aching!) At this point, the lead issues seem more frightening, though we are considering investing in a costly whole-house water filtration system to deal with both. How can we determine the relative risk to pregnant women for lead in the water vs. TTHMs? I suppose that could differ from house to house. What sort of whole-house filtration would you recommend?

- Are there any other considerations that you think I should keep in mind?

Even for those residents who are privileged to be educated and able to afford water filtration devices, the public water issues we are living with are confounding. The information we receive about our public water supply tends to be fragmented and coming from local public officials who have an interest in downplaying public concerns. In the meantime, it is very difficult to make truly informed decisions about our health.

Thank you in advance for any insights you can share and helping to give my baby a good start in life. I understand if you need to respond as a fellow resident of the world and as experts in general rather than as affiliates of the organizations in which you are employed.

Thank you much,

> We are responding to your email of July 11, 2015 to Miguel Del Toral. He is out of the office today, but has provided the following information to your lead questions. Overall, he agrees with Marc's responses on the water filter. Filters that are certified to remove lead are typically designed to remove 99 percent of the lead. They are also designed with additional capacity as a safety measure, but you should still change the filter in accordance with the manufacturer's instructions. If you identify elevated lead levels from other taps that do not have water filters, we suggest either adding a filter to those, such as the bathroom tap, or only using the filtered tap water for consumption.
>
> If you are still interested in having your water tested you should use a laboratory that has been certified by the State for drinking water analyses (a list is available from the following link: http://www.michigan.gov/deq/0,4561,7-135-3307_4131_4156-36940--,00.html. Please note that a first-draw sample, regardless of pre-flushing, is best for identifying lead that comes from the faucet and other in-home piping or fittings close to the faucet. First-draw sampling does not give a good indication of the lead contribution from sources further

from the faucet (i.e. lead service line, leaded brass meter, etc.). Information for residents about first-draw sampling instructions can be found on the last page of the 2006 memo on aerators and LCR sampling at the following link: http://www.epa.gov/ogwdw/lcrmr/pdfs/memo_tapsamples-aerators_10202006.pdf. In addition, below are two graphics from our Region 5 website with information about how to identify if you have a lead service line coming into your home and for faucets that do not have filters on them, how to clean the aerators.

Regarding your TTHM question, EPA has considered developmental and reproductive risks from multiple intake routes of exposure (e.g., ingestion, inhalation, and dermal) in our 2006 Disinfectants and Disinfection Byproducts (DBPR) rule. Some studies did suggest associations between TTHM exposure and various adverse reproductive and development health effects. However, studies available overall showed inconsistent results. As such, our Agency could not conclude whether exposure to TTHMs could cause adverse reproductive/developmental health effects. However, we did note in our findings that there was the potential for concern.

Currently, we are in the process of re-evaluating our DBPR rules and considering new toxicological data regarding reproductive and developmental health effects. Until our evaluation is complete, pregnant women can elect to take additional precautionary measures such as taking shorter showers, venting the room while showering/bathing, and not ingesting water with high TTHM concentrations.

We hope this information is helpful to you.

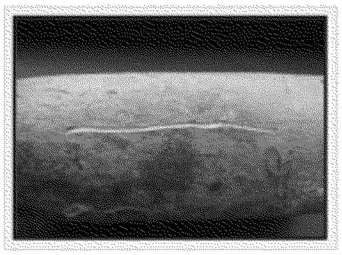
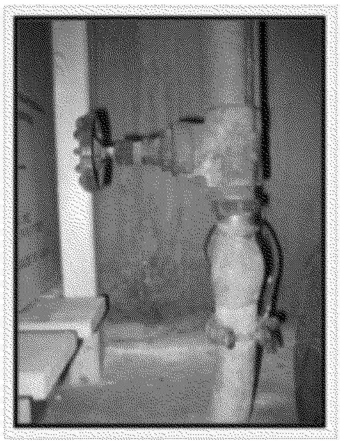
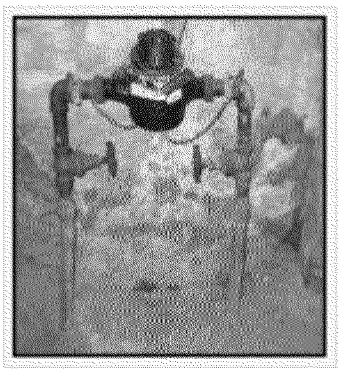
What do lead service lines look like?



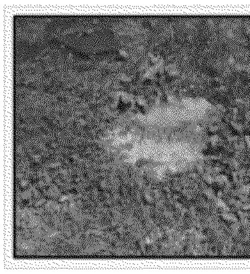
Lead service lines are generally a dull gray color and are very soft. You can identify them easily by carefully scratching with a key. If the pipe is made of lead, the area you've scratched will turn a bright silver color. Do not use a knife or other sharp instrument and take care not to puncture a hole in the pipe.



Lead service lines can be connected to the residential plumbing using solder and have a characteristic solder "bulb" at the end, a compression fitting, or other connector made of galvanized iron or brass/bronze.



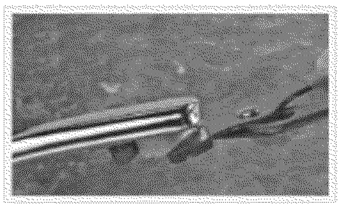
Lead service lines often end just inside the front or side wall of the home, but may extend further into the building as shown, where the lead service line comes out of the basement floor to the water meter and then back into the floor, continuing further into the building.



If your home has a wa
meter, your water me
may be in your home
"meter pit" or "meter
as shown above.

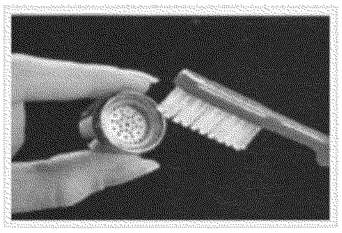
Cleaning aerators

Many taps have an aerator as part of the faucet assembly. Aerator screens are not intended to remove contaminants i
water, but may trap sediment or debris as water passes through the faucet. Lead-bearing sediment may end up in dr
water from physical corrosion of leaded solder and can build up in the aerator over time.



1. Remove the aerator by twisting off with hands or pliers.

2. One or more parts are contained within the aerator. Note the order and orientation of the parts as you remove them.



3. Rinse the pieces with water and brush off the debris. For deposits that are difficult to remove, soak the parts in water for a few minutes and scrub with a toothbrush. Backwashing aerator components is also an effective cleaning method for many aerator types. Hold the removed aerator upside down under flowing water to backwash screens and mesh filters.

4. Reassemble the a
screw it back onto th
and hand-tighten. If
parts are cracked or
broken, replace then
washer has hardene
should be replaced.

Subject: Flint Water Question from a Pregnant Flint Resident

Dear Dr. Edwards and Dr. Del Toral,

Thank you for the work you have already done in my city to protect families from water contaminant exposure. I am a Flint resident, pregnant with my first child, and therefore advised to drink a whopping 10-16 cups of water each day. I am writing to see if you can shed some light or point me to another source for answers regarding water testing and the safest option for staying hydrated.

If your wife or sister or friend were living in Flint and pregnant, what course of action would you recommend she take? Here is my situation:

- A little background: Prior to becoming pregnant, I installed a pur advanced water filter on our kitchen faucet and always use it when drinking from the tap, which I do frequently. (According to the pur website, the filter is said to filter out 70+ chemicals. Recently, I contacted the company to request more information on exactly what chemicals are filtered and up to what level, and am awaiting their reply.) When using the filter, the water is crystal clear, free of the river smell and without the slight yellow tinge that we sometimes have coming out of the tap (unlike in our bathroom sink which I use to brush my teeth...). I was compelled to purchase the filter because my legs began to swell after Flint changed to the river water, and after installing the filter this problem went away. I even tested the difference by drinking filtered water some days (consistently no swelling) and and unfiltered water others (consistent swelling) for a week or two. I understand the swelling to be the result of sodium chloride in our water which is corrosive enough to make GM stop using Flint water in their local plant (http://www.mlive.com/news/flint/index.ssf/2014/10/general_motors_wont_use_flint.html)

- Given your findings of high levels of lead in some residents' water, my husband strongly believes that I should cease drinking all Flint water and drink bottled water instead. However, I have read extensively about safety concerns of plastic-bottled water (chemists who work with plastics avoid drinking it) and this does not seem to be a safer option despite frequent bottled water drives organized by well-meaning activists across Flint.

- I would like to test our house's tap water with and without the kitchen filter using an independent lab, but my husband thinks this will be a futile effort because we have no reliable way of knowing if the results on one day will be consistent with results on other days, such as if the City of Flint were doing some special change to the water treatment procedure. Subject: RE: Flint lead sampling results?

Hi Jen,

The State is supposed to do the 90th percentile calculation using whatever samples were collected, rather than waiting until the full required number are collected.

Here's an excerpt from WSG-174 that covers the issue (source = http://water.epa.gov/lawsregs/guidance/sdwa/upload/wsg_174.pdf):

4) What should states do to calculate compliance if the minimum number of samples are not collected?

As noted in guidance released earlier this year[1], states must calculate the 90th percentile even if the minimum number of samples are not collected. The LCR states that the 90th percentile level is calculated based on "all samples taken during a monitoring period" and does not require that the minimum required number of samples must be collected in order to calculate the 90th percentile level. [40 CFR 141.80(c)]

---

[1] See March 9, 2004 memorandum from Cynthia Dougherty to Jane Downing at http://www.eap.gov/safewater/lcrmr/pdfs/memo_lcmr_lead_compliance_calculation.pdf

---

A system which fails to collect the minimum required number of samples incurs a monitoring and reporting violation and is thus required to conduct Tier 3 Public Notification (PN) [40 CFR 141.204(a)] and report the violation in its Consumer Confidence Report (CCR) [40 CFR 141.153(f)(1)]. The system will return to compliance for the monitoring and reporting violation when it completes these tasks and had completed appropriate monitoring and reporting for two consecutive 6-month monitoring periods (or one round of monitoring for a system on reduced monitoring). [*State Implementation Guidance for the LCRMR*, EPA-816-R-01-021]

Calculating the 90th Percentile

40 CFR § 141.80(c)(3) - "The 90th percentile lead and copper levels shall be computed as follows:
(i) The results of all lead and copper samples taken during a monitoring period shall be placed in ascending order from the sample with the lowest concentration to the sample with the highest concentration. Each sampling result shall be assigned a number, ascending by single integers beginning with the number, ascending by single integers beginning with the number 1 for the sample with the lowest contaminant level. The number assigned to the sample with the highest contaminant level shall be equal to the total number of samples taken.
(ii) The number of samples taken during the monitoring period shall be multiplied by 0.9.
(iii) The contaminant concentration in the numbered sample yielded by the calculation in paragraph (c)(3)(ii) is the 90th percentile contaminant level.
(iv) For water systems serving less than 100 people that collect 5 samples per monitoring period, the 90th percentile is computed by taking the average of the highest and second highest concentrations.

5) What is a proper sample?

We have received numerous requests to clarify the LCR with respect to proper samples and grounds for invalidation.

One other note, exceeding the action level for Pb isn't an LCR violation. Exceeding the action level triggers other requirements (depending on system size/status this would be things like public education, corrosion control installation/optimization, lead service line replacement, etc.).

Thanks,

Andrea Porter

Looks like the State is waiting to get the remaining lead samples so they can calculate the 90th percentile, then they will provide us with the 90th percentile. If we want to see the analytical results of how the 90th percentile was calculated, then Tinka will have to finesse that request with Liane, I think. This whole incident has serious strained my relationship with the State.

Subject: Flint lead sampling results?

Steve/Mike/Pat—Thank you for cluing me in to the fact that Liane and Tinka are talking about Flint next Tuesday. I guess it's just a manager discussion, from what I understand. I understand that Flint didn't get the minimum number of lead samples (100) for the second 6-month monitoring period that ended June 30, so I assume Flint is collecting the remaining samples now. Our Division Director, Tinka Hyde asked today if we will know what the lead results are from the second 6-month monitoring period. Perhaps you don't know what the results are for the remaining samples Flint began taking in July; but do you know what the other 80+ sample results are? Would you be able to share this information with us prior to the call on Tuesday? If not, Liane can share this info regarding the status of the sampling and the sample results with Tinka on Tuesday.

Thank you all for your hard work with Flint and with your management; I know this has not been an easy problem to deal with for anyone.

All--Below are my draft notes from our call last week, June 10, 2015. Thank you all for participating. I apologize for the delay in getting these out in draft to you all for review--I was hoping to get a couple of items ironed out that were fuzzy during our discussions, but hasn't happened yet. Several ACTION items below. So, please review to make sure I documented our discussion/agreements correctly, and feel free to edit as needed. I you could get back to me by July 13, that would be great. Thank you!

Jennifer

Attendees:
MDEQ: Liane Shekter-Smith, Richard Benzie, Carrie Monosmith, Kris Philip, Dan Dettweiler, Marjorie Rodriguez (Student), Kevin Holdwick, Mike Prysby, Dana DeBruyn, Steve Busch
EPA Region 5: Tom Poy, Rita Bair, Nick Damato, Janet Kuefler, Michele Palmer, Tom Murphy, Heather Shoven, Cary McElhinney, Andrea Porter, Miguel Deltoral, Mostafa Noureldin

Summary:

1.Changes in Lead Disinvestments and Commitments for FY 2016 ARDP--for discussion: Due to our extreme focus on lead in drinking water, this is the consensus here.

a. Consumer notification of tap results at NTNCWSs:
(Suggested wording) The NCWS program commits to full implementation of the lead consumer notification of tap results requirement, to begin in CY 2016. Region 5 will assist in a notification outreach effort in late FY 2015 to remaining 698 NTNCWSs that are not schools/daycares, to begin providing lead consumer notice in CY 2016. NCWS program commits to include information on providing lead consumer notice in the annual monitoring letter sent to all NTNCWSs for CY 2016.

STATE: The State found this change in the wording acceptable.

b. Collection of Lead samples at NTNCWSs during June - September 2016 timeframe
(Suggested wording) NCWS program commits to including information in the applicable NTNCWS annual monitoring letters of the requirement to collect their annual/triennial lead sample between June and September only, during CY 2016. The MDEQ NCWS program currently does not have the capability to easily track lead sampling compliance within this specific timeframe.

STATE: The State found this change in the wording acceptable.

c. Follow-up Actions for NTNCWSs that sample outside of June-September 2015 timeframe
(From 5/5/15 call notes w/EPA) MDEQ commits to providing Region 5 with all CY 2015 lead (and copper?) sample data for all NTNCWSs by March 2016 so that EPA can analyze how many PWSs monitored outside the June through October timeframe. EPA commits to follow-up with MDEQ to discuss follow-up actions.

STATE: The State agreed to providing EPA R5 the raw lead and copper data for all CY 2015 for all NTNCWSs. The WaterTrack database does have data, but it can't generate violations. MDEQ doesn't commit to enforcing against 2016 violators in FY 2016. The State said, it is planning on disinvesting in enforcing against these violators due to limited capability of WaterTrack; however, if the State's noncommunity data management capabilities improve during FY 2016, implementation of this disinvestment may become a reality. The State has not designated an alternate timeframe, or done system specific documentation as to why the system qualifies for a different timeframe.

d. Submittal of the lead and copper reporting form
(Suggested wording) MDEQ commits to requiring CWSs and NTNCWSs to submit the lead and copper reporting form via the annual monitoring letters to each system, tracking CWSs and NTNCWSs submittal of the lead and copper reporting form, and commits to issuing violations for failure to submit the lead and copper reporting form. The reporting form provides the address of the sample site, designates sampling site selection criteria, and explanation(s) for any changes in sampling sites.

STATE: Dan Dettweiler stated that the NCWS program was not in a position to do this for the NTNCWSs at this time. Tom Murphy asked how does WaterTrack handle/track high lead results? Tom M said there is a truncation issue on the sample location name field. Dan acknowledged that this problem has been identified, and the Department of Technology Management and Budget (DTMB) has been trying to fix this problem, but it is a challenging problem. Dan stated that sample sites for NTNCWSs are actually identified by LHDs during the sanitary survey and are documented in the sanitary survey. The LHDs check the pdf of the laboratory results that clearly states where the sample was taken, and calculates the 90th percentile. However, Dan stated that the requirement to send in the lead and copper reporting form is not currently in the LHD annual monitoring letter sent to each system. The NTNCWSs do not couple this form to the Lead Consumer Notice, as does the CWSs. Kris Philip pointed out that the LHDs select the sample sites, thus when they are calculating the 90th percentile, they are actually double checking the sites with the results.

From our discussion, the Region concluded that at this time, the LHDs are actively reviewing the lead and copper results and the sample locations when they calculate the 90th percentiles to ensure proper LCR monitoring is conducted by ALL NTNCWSs at the proper sample sites. After our call, I asked for verification of this statement, and Dan Dettweiler responded, "Just as with an exceeding value of an MCL, WaterTrack alerts the LHD when at least one sample for a water system exceeds the AL. A 90th percentile calculation is made only when an exceeding result alerts the LHD. For cases where there are no exceeding results, private lab samples are reviewed at the time LHDs hand-enter them into WaterTrack. State lab samples, which flow electronically via nightly downloads from the state lab database, are reviewed when pdfs of the analysis reports are, routinely, emailed by the state lab to LHDs. Beyond that, MDEQ's annual evaluation of the LHDs provides another opportunity for us to oversee the proper assigning and use of designated sampling locations."

ACTION: The Region will discuss Dan's response internally, and get back to the State with any issues/concerns.

Kris Philip said that the CWS program is requiring that the systems submit the form, but they are not enforcing whether or not the system submits the form. Often, the CWS will submit the Lead Consumer Notice and the Lead and Copper reporting form together. Kris said if 90%+ are already submitting the forms, then the State will agree to follow-up and enforce this requirement. But, if less than that, will probably be too much of a burden. Kris said they may change the way DEQ is tracking in SDWIS during FY 2016. But, the Region said SDWIS-Prime probably won't be available until 2017 at the earliest.

ACTION: Kris Philip will research with the District Offices to determine the current submittal rate of the lead and copper reporting form from CWSs; and report back to the Region.

2. Enforcement Update with Heather
   NTNCWSs under Bottled Water agreements due to Arsenic MCL violations:
   Per discussions with Region 5 and the February 2014 EPA/OECA memo, MDEQ has closed the old Arsenic open-ended MCL violations; however, no further quarterly monitoring is being conducted at the (±27) systems that are still under bottled water agreements. Thus, no more arsenic MCL violations will be reported for these systems and these systems will not become priority systems (ETT score of 11 or more) since only one arsenic MCL violation will be reported (5 points) even though they have a longstanding issue with arsenic noncompliance. The Region would like to discuss the pros and cons of placing these PWSs with arsenic MCL violations on quarterly monitoring as required under 40 CFR Section 141.23(c)(7); and brainstorm possible solutions.

Heather provided an update on how the State is doing in returning ETT systems to compliance; the State is doing very well in achieving its commitment for FY 2015. Heather said the Region is glad to see the State and LHD prioritization of implementation of the drinking water program and NTNCWS schools and daycares.
Referring to the NTNCWSs under BW agreements that are in violation of the Arsenic MCL, Heather said that since there are no more open-ended MCL violations in SDWIS, that no MCL violations can be reported to SDWIS unless there is monitoring to show the system is in non-compliance. Even though the LHD has indicated that these systems are drinking bottled water for public health protection, the use of bottled water cannot be a permanent solution to the fact that the system's drinking water at the tap continues to exceed the MCL for arsenic. Dan said there are 22 systems, where 8 are schools, that should be conducting quarterly monitoring. Dana said that letters have been sent (OR drafted?) to these 22 systems to require quarterly sampling for arsenic; these 22 systems are in 10 different counties so the message from the State is consistent. A secondary effect of this new requirement for the systems, may be that they transition to another water source or install treatment sooner.

The State voiced a concern that multiple quarterly violations could potentially affect the State's relationship with the LHDs financially. Genesee and Oakland Counties have quite a number of noncommunity water systems. Multiple quarterly violations could affect the Dept of Community Health's determination as to whether the LHDs are meeting their minimum program requirements; thus receive full funding for their work with the noncommunity systems for the drinking water program. The LHDs cannot have more than 20% of their systems with violations. The Region wonders how much funding would be cut from a LHD contract if it exceeds the 20% noncompliance level set in the contract?

3. Status of Flint
   a. TTHM levels for May--Due to MDEQ district engineer June 10-RECEIVED; see link to results
   https://www.cityofflint.com/2015/06/01/may-water-testing-results-show-all-locations-are-within-acceptable-limits-for-tthm/
   All samples below the TTHM MCL; one site still has an LRAA above the MCL but decreased from 105 ppb in Feb to 93.5 ppb in May.

   Mike Prysby said he is getting ready to issue the construction permit to the City of Flint to install a GAC filter in July, that will remove more TOC to further reduce the potential of developing TTHMs. Mike said he has already issued a construction permit for a transmission line within the City that will help reduce water age.

b. Lead in Flint

Our discussions with MDEQ indicate that no phosphates/corrosion control has been added to the system since April 2014 when the source of drinking water changed to the Flint River. We understand that the City is just finishing up its second set of 6-month initial monitoring for lead; where the results will probably warrant a Corrosion Control Study to be conducted. Since Flint has lead service lines, we understand some citizen-requested lead sampling is exceeding the Action Level, and the source of drinking water will be changing again in 2016, so to start a Corrosion Control Study now doesn't make sense. The idea to ask Flint to simply add phosphate may be premature; there are many other issues and factors that must be taken into account which would require a comprehensive look at the water quality and the system before any treatment recommendations can/should be made. Miguel is recommending MDEQ and EPA? approach Flint about formally requesting EPA's Office of Research and Development in Cincinnati support on the lead in Flint drinking water issue, and request that Mike Schock, ORD, and possibly Darren Lytle, ORD, to participate in Flint's drinking water advisory committee so that a comprehensive evaluation on how to proceed can be discussed.

Miguel provided a brief summary of the high lead results found at the residence of Citizen name / Ex. 6 Citizen name / Ex. 6 in Flint. Miguel will follow up with a written summary of the work conducted, sample results, and conclusions.
Miguel believes that lead levels in Flint are being affected by the lack of Corrosion Control being conducted by the City, since the LCR requires 2 6-month initial monitoring for a new source. Steve Busch stated that in the Lead sampling pool, almost all of the lead sample sites are lead service lines, and the State is not seeing large increases in lead levels at the tap. Miguel suggested that EPA experts in Lead, Mike Schock; and in distribution systems, Darren Lytle, be added to the Flint drinking water advisory committee to assist the City/State in determining the best way to proceed to minimize lead in the City's drinking water during the interim use of the Flint River, and subsequent use of Lake Huron water.

Miguel said he will send Mike Schock and Darren Lytle's contact information to Steve and Mike. Steve pointed out that the City is following the LCR requirements, and completing the requirements in a timely manner. Miguel's point is that since the LCR was promulgated 20+ years ago, that research and different situations, like Washington D.C., have educated scientists, experts, and regulators that the existing requirements in the LCR may not be as protective as previously thought. Thus, he can only make recommendations as to how to revise sampling protocols. And Miguel acknowledges that it may be another year before these regulation changes are promulgated in the Long-Term Lead and Copper Rule. In December 2015, the NDWAC recommendation is expected.

The Region asked the State if the Flint River will be a permanent supplemental source of drinking water, once the City of Flint connects with the Karegdodi pipeline from Lake Huron. Mike Prysby said that the City is currently pumping 22MGD, but the City has 40-50 MG of storage. The City is currently working on reducing its unaccounted for water losses, and these water losses are dropping. The State, through the Governor's office, provided disadvantaged system funding, $2M which includes $900K for lead detection, and pipe inspection.

4. Update on WaterTrack to SDWIS-State: The migration of WaterTrack data to SDWIS-State was number 39 on the Dept of Technology Management and Budget's (DTMB) project list last year; this year it is number 30. It doesn't appear this project has a high priority. Does the State have any new information on the progress of this project?

Dan said that the migration of WaterTrack data to SDWIS-State has moved to a priority of 26 with DTMB so far this year. But Dan said they are going to take this project out of the que, since Ronda Page has returned to the drinking water program from DTMB. Ronda said she re-estimated DTMB's involvement in this project to be far less than originally thought, so there is no need for any program developers or the tech team. This project will only need the Data Team and the web designers only. Ronda said they can set-up on a new server and migrate the data from WaterTrack to SDWIS-State themselves; in-house. Kris Philip remembers migrating the

CWS data to SDWIS-State, so she can be a resource for this project. The parts that are needed to be completed by DTMB could be contracted out. Cary McElhinney said that there is a process of withholding PWSS grant funds and re-directing the funds to a HQ contract with SAIC. Richard Benzie said the process worked well last year when MI used PWSS funds to contract with a HQ contractor to conduct NEEDS survey training.

ACTION: Jen will follow up with State and Tribal Programs Branch about the process and timing of holding back funds from the PWSS grant for the purpose of contracting with SAIC.

5. Consequences of cutting the State drinking water program to a "minimal program"
Jennifer had a discussion with Richard Benzie regarding the possibility of the Michigan State Legislature looking to have just a minimal drinking water program, meaning only a program with activities that are required by the Federal SDWA. Jennifer ultimately discussed this internally with Tom Poy. The minimal program suggested would cut out Operator Certification, Capacity Development, Plan Review, Cross Connection Control, Source Water Protection, among other programs that are State required. Operator Certification and Capacity Development, while not required by the Federal regulations, do have financial strings attached. And Plan review/construction permits are required by the SRF program for a loan. Any recent communication with the State Legislature that they might proceed and make this possibility a reality?

Richard and Liane said there is no current threat from the State Legislature to cut the State-funded PWSS program activities. But there is a State-wide impetus to delete old programs and regulations, so this could lead to questioning the purpose of State-funded PWSS program activities. Richard is just being proactive in preparing a justification. Richard remembers a discussion many years ago about what constitutes a "comprehensive drinking water program". Tom Poy and Jennifer commented in a previous communication with Richard that the EPA PWSS primacy program and the State-funded activities in the drinking water program were meant to complement each other. To support this statement, Jennifer sent Richard some PWSS Priority guidance from the 90's, some preamble language from the 1976 SDWA found by our attorney, and language from Section 142 of the SDWA regulations from 1976 that might assist him in his justification.

6. EPA's Resource Message at the LHD Workshop in April
From the 2014 analysis of Shared Goals 2013 data, which is compliance data, for noncommunity systems, there are increasing trends of nitrate M/R violations for both NTNCWSs and TNCWSs. We discussed this on the last semi-annual call. Analysis of the 2015 Shared Goals 2014 data (April 2015) shows an improvement--that of decreasing numbers of bacti/nitrate M/R violations.

However, in light of the upcoming implementation of RTCR in 2016, the question raised here in the Region is:
Does the State have a plan with the LHDs as to what activities must be prioritized, and what will fall off the plate? Not all LHDs will need to disinvest based upon each LHD's resources, but some poorly funded LHDs may have to disinvest in some activities/drop activities that have no risk to public health.

Carrie Monosmith said that she met with the RTCR workgroup, comprised of LHD Directors/sanitarians, last fall to identify activities that the state can disinvest in during the next

> several years as the LHDs begin implementation of RTCR. They could not identify any activity that could be dropped. The main thing that will help the LHDs save time is to get the electronic DWR (eDWR) going, or the CMD portal, which will drastically reduce the LHDs time in inputting laboratory data into WaterTrack/SDWIS-State. From there, they can develop electronic data forms (CROMEER compliant) that the systems can submit.

Thank you!

Jennifer

Subject: CWS--lead and copper reporting form

Hi, Kris. We're just about done with negotiating with Dana and Dan about this topic for the NCWSs, so I was wondering if you've had time to check with the CWSs? See the item below (in red) from our call in June; there's an action item below for you on this topic. I know you've been busy--ME TOO! I was hoping this summer would be quieter, but didn't happen...

Subject: Draft Notes from Michigan semi-annual call on 6/10

All--Below are my draft notes from our call last week, June 10, 2015. Thank you all for participating. I apologize for the delay in getting these out in draft to you all for review--I was hoping to get a couple of items ironed out that were fuzzy during our discussions, but hasn't happened yet. Several ACTION items below. So, please review to make sure I documented our discussion/agreements correctly, and feel free to edit as needed. I you could get back to me by July 13, that would be great. Thank you!

Jennifer

Attendees:

MDEQ: Liane Shekter-Smith, Richard Benzie, Carrie Monosmith, Kris Philip, Dan Dettweiler, Marjorie Rodriguez (Student), Kevin Holdwick, Mike Prysby, Dana DeBruyn, Steve Busch
EPA Region 5: Tom Poy, Rita Bair, Nick Damato, Janet Kuefler, Michele Palmer, Tom Murphy, Heather Shoven, Cary McElhinney, Andrea Porter, Miguel Deltoral, Mostafa Noureldin

Summary:

1.Changes in Lead Disinvestments and Commitments for FY 2016 ARDP--for discussion: Due to our extreme focus on lead in drinking water, this is the consensus here.

a. Consumer notification of tap results at NTNCWSs:
(Suggested wording) The NCWS program commits to full implementation of the lead consumer notification of tap results requirement, to begin in CY 2016. Region 5 will assist in a notification outreach effort in late FY 2015 to remaining 698 NTNCWSs that are not schools/daycares, to begin providing lead consumer notice in CY 2016. NCWS program commits to include information on providing lead consumer notice in the annual monitoring letter sent to all NTNCWSs for CY 2016.

STATE: The State found this change in the wording acceptable.

b. Collection of Lead samples at NTNCWSs during June - September 2016 timeframe
(Suggested wording) NCWS program commits to including information in the applicable NTNCWS annual monitoring letters of the requirement to collect their annual/triennial lead sample between June and September only, during CY 2016. The MDEQ NCWS program currently does not have the capability to easily track lead sampling compliance within this specific timeframe.

STATE: The State found this change in the wording acceptable.

c. Follow-up Actions for NTNCWSs that sample outside of June-September 2015 timeframe
(From 5/5/15 call notes w/EPA) MDEQ commits to providing Region 5 with all CY 2015 lead (and copper?) sample data for all NTNCWSs by March 2016 so that EPA can analyze how many PWSs monitored outside the June through October timeframe. EPA commits to follow-up with MDEQ to discuss follow-up actions.

STATE: The State agreed to providing EPA R5 the raw lead and copper data for all CY 2015 for all NTNCWSs. The WaterTrack database does have data, but it can't generate violations. MDEQ doesn't commit to enforcing against 2016 violators in FY 2016. The State said, it is planning on disinvesting in enforcing against these violators due to limited capability of WaterTrack; however, if the State's noncommunity data management capabilities improve during FY 2016, implementation of this disinvestment may become a reality. The State has not designated an alternate timeframe, or done system specific documentation as to why the system qualifies for a different timeframe.

d. Submittal of the lead and copper reporting form
(Suggested wording) MDEQ commits to requiring CWSs and NTNCWSs to submit the lead and copper reporting form via the annual monitoring letters to each system, tracking CWSs and NTNCWSs submittal of the lead and copper reporting form, and commits to issuing violations for failure to submit the lead and copper reporting form. The reporting form

provides the address of the sample site, designates sampling site selection criteria, and explanation(s) for any changes in sampling sites.

STATE: Dan Dettweiler stated that the NCWS program was not in a position to do this for the NTNCWSs at this time. Tom Murphy asked how does WaterTrack handle/track high lead results? Tom M said there is a truncation issue on the sample location name field. Dan acknowledged that this problem has been identified, and the Department of Technology Management and Budget (DTMB) has been trying to fix this problem, but it is a challenging problem. Dan stated that sample sites for NTNCWSs are actually identified by LHDs during the sanitary survey and are documented in the sanitary survey. The LHDs check the pdf of the laboratory results that clearly states where the sample was taken, and calculates the 90th percentile. However, Dan stated that the requirement to send in the lead and copper reporting form is not currently in the LHD annual monitoring letter sent to each system. The NTNCWSs do not couple this form to the Lead Consumer Notice, as does the CWSs. Kris Philip pointed out that the LHDs select the sample sites, thus when they are calculating the 90th percentile, they are actually double checking the sites with the results.

From our discussion, the Region concluded that at this time, the LHDs are actively reviewing the lead and copper results and the sample locations when they calculate the 90th percentiles to ensure proper LCR monitoring is conducted by ALL NTNCWSs at the proper sample sites. After our call, I asked for verification of this statement, and Dan Dettweiler responded, "Just as with an exceeding value of an MCL, WaterTrack alerts the LHD when at least one sample for a water system exceeds the AL. A 90th percentile calculation is made only when an exceeding result alerts the LHD. For cases where there are no exceeding results, private lab samples are reviewed at the time LHDs hand-enter them into WaterTrack. State lab samples, which flow electronically via nightly downloads from the state lab database, are reviewed when pdfs of the analysis reports are, routinely, emailed by the state lab to LHDs. Beyond that, MDEQ's annual evaluation of the LHDs provides another opportunity for us to oversee the proper assigning and use of designated sampling locations."

ACTION: The Region will discuss Dan's response internally, and get back to the State with any issues/concerns.

Kris Philip said that the CWS program is requiring that the systems submit the form, but they are not enforcing whether or not the system submits the form. Often, the CWS will submit the Lead Consumer Notice and the Lead and Copper reporting form together. Kris said if 90%+ are already submitting the forms, then the State will agree to follow-up and enforce this requirement. But, if less than that, will probably be too much of a burden. Kris said they may change the way DEQ is tracking in SDWIS during FY 2016. But, the Region said SDWIS-Prime probably won't be available until 2017 at the earliest.

ACTION: Kris Philip will research with the District Offices to determine the current submittal rate of the lead and copper reporting form from CWSs; and report back to the Region.

2. Enforcement Update with Heather

Enforcement/Investigatory / Ex. 7A Not Related to Flint

Enforcement/Investigatory / Ex. 7A Not Related to Flint

3. Status of Flint
   a. TTHM levels for May--Due to MDEQ district engineer June 10-RECEIVED; see link to results https://www.cityofflint.com/2015/06/01/may-water-testing-results-show-all-locations-are-within-acceptable-limits-for-tthm/

   All samples below the TTHM MCL; one site still has an LRAA above the MCL but decreased from 105 ppb in Feb to 93.5 ppb in May.

   Mike Prysby said he is getting ready to issue the construction permit to the City of Flint to install a GAC filter in July, that will remove more TOC to further reduce the potential of developing TTHMs. Mike said he has already issued a construction permit for a transmission line within the City that will help reduce water age.

   b. Lead in Flint

   Our discussions with MDEQ indicate that no phosphates/corrosion control has been added to the system since April 2014 when the source of drinking water changed to the Flint River. We understand that the City is just finishing up its second set of 6-month initial monitoring for lead; where the results will probably warrant a Corrosion Control Study to be conducted. Since Flint has lead service lines, we understand some citizen-requested lead sampling is exceeding the Action Level, and the source of drinking water will be changing again in 2016, so to start a Corrosion Control Study now doesn't make sense. The idea to ask Flint to simply add phosphate may be premature; there are many other issues and factors that must be taken into account which would require a comprehensive look at the water quality and the system before any treatment recommendations can/should be made. Miguel is recommending MDEQ and EPA? approach Flint about formally requesting EPA's Office of Research and Development in Cincinnati support on the lead in Flint drinking water issue, and request that Mike Schock, ORD, and possibly Darren Lytle, ORD, to participate in Flint's drinking water advisory committee so that a comprehensive evaluation on how to proceed can be discussed.

Miguel provided a brief summary of the high lead results found at the residence of Citizen name / Ex. 6 Citizen name / Ex. 6 in Flint. Miguel will follow up with a written summary of the work conducted, sample results, and conclusions.
Miguel believes that lead levels in Flint are being affected by the lack of Corrosion Control being conducted by the City, since the LCR requires 2 6-month initial monitoring for a new source. Steve Busch stated that in the Lead sampling pool, almost all of the lead sample sites are lead service lines, and the State is not seeing large increases in lead levels at the tap. Miguel suggested that EPA experts in Lead, Mike Schock; and in distribution systems, Darren Lytle, be added to the Flint drinking water advisory committee to assist the City/State in determining the best way to proceed to minimize lead in the City's drinking water during the interim use of the Flint River, and subsequent use of Lake Huron water.

Miguel said he will send Mike Schock and Darren Lytle's contact information to Steve and Mike. Steve pointed out that the City is following the LCR requirements, and completing the requirements in a timely manner. Miguel's point is that since the LCR was promulgated 20+ years ago, that research and different situations, like Washington D.C., have educated scientists, experts, and regulators that the existing requirements in the LCR may not be as protective as previously thought. Thus, he can only make recommendations as to how to revise sampling protocols. And Miguel acknowledges that it may be another year before these regulation changes are promulgated in the Long-Term Lead and Copper Rule. In December 2015, the NDWAC recommendation is expected.

The Region asked the State if the Flint River will be a permanent supplemental source of drinking water, once the City of Flint connects with the Karegdodi pipeline from Lake Huron. Mike Prysby said that the City is currently pumping 22MGD, but the City has 40-50 MG of storage. The City is currently working on reducing its unaccounted for water losses, and these water losses are dropping. The State, through the Governor's office, provided disadvantaged system funding, $2M which includes $900K for lead detection, and pipe inspection.

4. Update on WaterTrack to SDWIS-State: The migration of WaterTrack data to SDWIS-State was number 39 on the Dept of Technology Management and Budget's (DTMB) project list last year; this year it is
number 30. It doesn't appear this project has a high priority. Does the State have any new information on the progress of this project?

Dan said that the migration of WaterTrack data to SDWIS-State has moved to a priority of 26 with DTMB so far this year. But Dan said they are going to take this project out of the que, since Ronda Page has returned to the drinking water program from DTMB. Ronda said she re-estimated DTMB's involvement in this project to be far less than originally thought, so there is no need for any program developers or the tech team. This project will only need the Data Team and the web designers only. Ronda said they can set-up on a new server and migrate the data from WaterTrack to SDWIS-State themselves; in-house. Kris Philip remembers migrating the CWS data to SDWIS-State, so she can be a resource for this project. The parts that are needed to be completed by DTMB could be contracted out. Cary McElhinney said that there is a process of withholding PWSS grant funds and re-directing the funds to a HQ contract with SAIC. Richard Benzie said the process worked well last year when MI used PWSS funds to contract with a HQ contractor to conduct NEEDS survey training.

ACTION: Jen will follow up with State and Tribal Programs Branch about the process and timing of holding back funds from the PWSS grant for the purpose of contracting with SAIC.

5. Consequences of cutting the State drinking water program to a “minimal program”
Jennifer had a discussion with Richard Benzie regarding the possibility of the Michigan State Legislature looking to have just a minimal drinking water program, meaning only a program with activities that are required by the Federal SDWA. Jennifer ultimately discussed this internally with Tom Poy. The minimal program suggested would cut out Operator Certification, Capacity Development, Plan Review, Cross Connection Control, Source Water Protection, among other programs that are State required. Operator Certification and Capacity Development, while not required by the Federal regulations, do have financial strings attached. And Plan review/construction permits are required by the SRF program for a loan. Any recent communication with the State Legislature that they might proceed and make this possibility a reality?

   Richard and Liane said there is no current threat from the State Legislature to cut the State-funded PWSS program activities. But there is a State-wide impetus to delete old programs and regulations, so this could lead to questioning the purpose of State-funded PWSS program activities. Richard is just being proactive in preparing a justification. Richard remembers a discussion many years ago about what constitutes a “comprehensive drinking water program”. Tom Poy and Jennifer commented in a previous communication with Richard that the EPA PWSS primacy program and the State-funded activities in the drinking water program were meant to complement each other. To support this statement, Jennifer sent Richard some PWSS Priority guidance from the 90's, some preamble language from the 1976 SDWA found by our attorney, and language from Section 142 of the SDWA regulations from 1976 that might assist him in his justification.

Aging Pipes Are Poisoning America's Tap Water

In Flint, Michigan, lead, copper, and bacteria are contaminating the drinking supply and making residents ill. If other cities fail to fix their old pipes, the problem could soon become a lot more common.

Flint residents received jugs of water from a church in February. Paul Sancya / AP

Alana Semuels

Jul 29, 2015

FLINT, Mich.—Melissa Mays looks around the emergency room at a frail, elderly man in a wheelchair and a woman with a hacking cough and can't quite believe she's here. Until a few months ago, she was healthy—an active mother of three boys who found time to go to the gym while holding down a job as a media consultant and doing publicity for bands.

But lately, she's been feeling sluggish. She's developed a rash on her leg, and clumps of her hair are falling out. She ended up in the emergency room last week after feeling "like [her] brain exploded," hearing pops, and experiencing severe pain in one side of her head.

Mays blames her sudden spate of health problems on the water in her hometown of Flint. She says it has a blue tint when it comes out of her faucet, and lab results indicate it has high amounts of copper and lead. Her family hasn't been drinking the water for some months, but they have been bathing in it, since they have no alternative.

"It set off a train wreck in my system," Mays told me, sitting in the emergency room. Later, doctors would put her on beta blockers after finding problems in the arteries around her brain.

In the past 16 months, abnormally high levels of e. coli, trihamlomethanes, lead, and copper have been found in the city's water, which comes from the local river (a dead body and an abandoned car were also found in the same river). Mays and other residents say that the city government endangered their health when it stopped buying water from Detroit last year and instead started selling residents treated water from the Flint River. "I've never seen a first-world city have such disregard for human safety," she told me.

While Flint's government and its financial struggles certainly have a role to play in the city's water woes, the city may actually be a canary in the coal mine, signaling more problems to come across the country. "Flint is an extreme case, but nationally, there's been a lack of investment in water infrastructure," said Eric Scorsone, an economist at Michigan State University who has followed the case of Flint. "This is a common problem nationally— infrastructure maintenance has not kept up."

Bethany Hazard says her water started coming out of the faucet brown and smelling like a sewer, and when she called the city to complain, she was told the water was fine.

Indeed, water scarcity in the parched West might be getting the most news coverage, but infrastructure delays and climate change are causing big problems for cities in the North and Midwest, too. Last summer, hundreds of thousands of people in Toledo were told not to drink tap water because tests showed abnormally high levels of microcystins, perhaps related to algae blooms in Lake Erie. Microcystins can cause fever, headaches, vomiting, and—in rare cases—seizures. Heavy rainfall has caused backups in the filtering process at overloaded water-treatment plants in Pennsylvania, and so residents are frequently finding themselves under advisories to boil water. And Chicago, which installed lead service lines in many areas in the 1980s, is now facing a spike in lead-contaminated tap water.

In 2013, America received a "D" in the drinking-water category of the American Society for Civil Engineers' Report Card for America's Infrastructure. The report found that most of the nation's drinking-water infrastructure is "nearing the end of its useful life." Replacing the nation's pipes would cost more than $1 trillion. The country's wastewater infrastructure also got a "D" grade.

Hydrant flushing in Flint (Alana Semuels)

Like many cities in America, Flint has lost residents but still has to provide services like water and sewer and road maintenance within the same boundaries. All while bringing in less tax revenue to pay for it. Flint has not had the money to spend on crucial infrastructure upgrades, and has left old pipes in place for longer than most engineers would recommend. Water prices are rising in Flint, like they are in lots of other cities, but the quality of water is getting worse, not better.

Flint has financially struggled for longer than most American cities. The birthplace of General Motors, the city began having problems in the 1980s and 1990s when GM started closing plants. By 2001, its unemployment rate was 11.2 percent, which grew every year until it reached 25 percent in 2009. Families began to seek opportunity elsewhere, leaving behind empty homes. As the city's population declined, it struggled to come up with the revenue to provide basic services such as police and fire coverage for residents. The water system, though, was still a "cash cow," said Scorsone, the professor, so Flint borrowed from the water authority to pay its city bills.

Flint has been buying water from Detroit since 1967. The Detroit Water and Sewer Department, in the booming post-war years, expanded its services, adding 1,000 square miles of territory. But as the population began to shrink in both Detroit and Flint, fewer customers were left to pay for infrastructure and services. Detroit began raising rates, but Flint didn't pass those rate increases on to customers because residents were struggling economically and politicians worried they'd get voted out of office, said Scorsone. That meant that little to no money was spent on infrastructure upgrades.

In 2004, Detroit charged Flint $11.06 per million cubic foot of water. By 2013, it was charging $19.12 per million cubic foot, a 73 percent increase.

"It's a combination of bad management and bad economics," Scorsone said.

Downtown Flint (Carlos Osorio/AP)

By 2011, Flint had a $15 million deficit and Michigan Governor Rick Snyder appointed an emergency manager to take control over the city. It was a move that upset many, since emergency managers are used to replace elected officials such as city councils and mayors and have widespread authority, but less connection to residents. In 2012, Michigan voters repealed an emergency-manager law that had allowed emergency managers to take over troubled cities and school districts. But the state legislature then passed a different, and more far-reaching, emergency-manager law later that year. A group of citizens, including some from Flint, filed a lawsuit arguing that the law violated their constitutional right to equal protection. In November, a judge allowed the suit to go forward.

Unwilling to pay rising Detroit water costs, Genesee County, where Flint is located, decided to work with other Michigan counties to build a pipeline from Lake Huron to mid-Michigan. But the pipeline, called the Karegnondi Water Authority, won't be completed until late 2016. So in 2013, Flint decided that until the pipeline was finished, it would pump water from the Flint River, treat it, and sell it to residents. The plan would save the city much-needed money: The annual cost to treat water from the Flint River is $2.8 million, said Howard Croft, the city's public-works director. Buying water from Detroit, on the other hand, costs $12 million a year.

But making river water safe for public use is a much more difficult task than treating reservoir or lake water. Rivers are subject to runoff and the water quality can change quickly with air temperature or heavy storms. Flint found this out as soon as it turned off the pumps from Detroit and started pumping its own water in April 2014.

Residents said they noticed the difference almost immediately. Melissa Mays says her water started smelling like rotten eggs, and had a strange tint when coming out of the faucet, sometimes blue, sometimes yellowish.

Claire McClinton, a GM retiree, said her house began to smell like garbage. Another resident, Bethany Hazard, says her water started coming out of the faucet brown and smelling like a sewer, and when she called the city to complain, she was told the water was fine.

The water was not fine. First, tests showed there was fecal coliform bacteria in the water, and the city had to issue numerous boil advisories to citizens. In response, engineers upped the amount of chlorine in its water, leading to dangerously high levels of trihalomethanes, or TTHMs, which put Flint in violation of the Clean Water Act. TTHMs are especially dangerous when inhaled, making showering in hot water toxic.

By October, GM, which still has a plant in Flint, had started noticing that the water was corroding parts of its engines. The plant switched off the Flint water, and started trucking in water from elsewhere. It asked the city for permission to use water from Flint Township, rather than the city of Flint (Flint Township was still buying water from Detroit), and switched back to Detroit water, said spokesman Tom Wickham.

LeeAnne Walters didn't notice any changes right away. But a few months after the switch, she noticed that her children were getting rashes between their fingers, on their shins, on the back of their knees. Her four-year-old son, who has a compromised immune system, started breaking out into scaly rashes whenever he swam in their salt-water pool, which he'd used since birth. Then Walters' 14-year-old son got extremely sick and missed a month of school.

So she sent her water off to Marc Edwards, a Virginia Tech environmental engineering professor who had forced the CDC to admit it had misled the public about the amount of lead in D.C.'s water.

Edwards was shocked when he found that Walters' lead content was 13,000 parts per billion. The EPA recommends keeping lead content below 15 parts per billion.

“At first I didn’t believe the results because they were the worst I’d ever seen, and I’ve seen a lot,” Edwards told me.

LeeAnne Walters shows a water filter from her home. (Alana Semuels)

None of the samples Walters sent were safe to drink. Some had lead content of 200 parts per billion. Over 30 samples, the average lead content was 2,000 parts per billion, which meant that no matter how long Walters let her taps run, it still would have been toxic. This could easily have been causing the health problems that Walters and her children were experiencing.

“Lead is the best known neurotoxin, it adversely impacts every system in the human body,” Edwards told me. “Certainly it could have caused children’s lead poisoning.”

The city says it does not know why so much lead was found in Walters’ pipes, but Edwards has a theory: Many cities have lead pipes, and when water sits in those pipes, the lead can leech into the water. So cities usually add corrosion-control chemicals, such as phosphates, to keep the lead out of the water. But because Flint didn’t take such precautions when they began pumping their own water, “the public health protection was gone,” Edwards says.

The water situation has made people furious with the city, and with the emergency-manager system of government. Residents say Flint first learned about the high levels of TTHMs in May 2014, but didn't inform residents until January. City meetings have devolved into a mob of angry residents yelling at the emergency manager.

"We still don't have a true democracy," said Claire McClinton, the retiree. "As soon as [the emergency manager] sets foot in your city, your local government is gone." In March, Flint's city council voted to "do all things necessary" to once again purchase water from Detroit, but the city's emergency manager nixed the vote, calling it "incomprehensible." The emergency manager stepped down in April, announcing that the city was on firmer financial footing, but one of his last orders was that the city council could not change any of his orders for a year, including the order to switch to Flint water.

Flint last week sent out yet another notice that tap water had higher than acceptable levels of TTHMs. There are currently two lawsuits pending about the water issues, one of which questions the city's financial accounting, another demands that the city go back to Detroit water because Flint's water quality is so poor.

Drainage into the Flint River (Alana Semuels)

Many Flint residents have a visceral reaction to the water problem, and have focused their attention on the emergency manager, on their city's finances, and on the unfairness of their situation.

"How many times can they kick the people who live here?" Melissa Mays asked me in frustration.

But it's not one emergency manager, or one bad decision about pumping water from the Flint River that has led these problems—and that might be the scariest part of all. Neglected infrastructure is really to blame, but it's not quite as satisfying to blame old pipes as it is to blame the people in charge. And the city's financial woes have a lot to do with its shrinking population, but it's hard to blame the people who left in hopes of finding employment or a better life elsewhere.

Eroding infrastructure isn't unique to Flint. Things just broke down there first.

In a report released to its members last month, the American Water Works Association warned that many utilities across the country won't have the money to perform much-needed infrastructure upgrades over the upcoming decades. Utilities are seeing water sales declining as households and commercial clients become more efficient, but, like Flint, still have to provide the same infrastructure as before with less revenue.

"There is a gap between the financial needs of water and wastewater systems and the means to pay for these services through rates and fees," the report read.

"They don't have money to even do the best practices according to our currently lousy best practices," says Edwards, of Virginia Tech. "They have even less money than normal to address these very, very expensive problems."

And if utilities can't pay for much-needed upgrades, other cities might soon find themselves in the same situation as Flint.

Aging Pipes Are Poisoning America's Tap Water

In Flint, Michigan, lead, copper, and bacteria are contaminating the drinking supply and making residents ill. If other cities fail to fix their old pipes, the problem could soon become a lot more common.

Flint residents received jugs of water from a church in February. Paul Sancya /

Jul 29, 2015

FLINT, Mich.—Melissa Mays looks around the emergency room at a frail, elderly man in a wheelchair and a woman with a hacking cough and can't quite believe she's here. Until a few months ago, she was healthy—an active mother of three boys who found time to go to the gym while holding down a job as a media consultant and doing publicity for bands.

But lately, she's been feeling sluggish. She's developed a rash on her leg, and clumps of her hair are falling out. She ended up in the emergency room last week after feeling "like [her] brain exploded," hearing pops, and experiencing severe pain in one side of her head.

Mays blames her sudden spate of health problems on the water in her hometown of Flint. She says it has a blue tint when it comes out of her faucet, and lab results indicate it has high amounts of copper and lead. Her family hasn't been drinking the water for some months, but they have been bathing in it, since they have no alternative.

"It set off a train wreck in my system," Mays told me, sitting in the emergency room. Later, doctors would put her on beta blockers after finding problems in the arteries around her brain.

In the past 16 months, abnormally high levels of e. coli, trihamlomethanes, lead, and copper have been found in the city's water, which comes from the local river (a dead body and an abandoned car were also found in the same river). Mays and other residents say that the city government endangered their health when it stopped buying water from Detroit last year and instead started selling residents treated water from the Flint River. "I've never seen a first-world city have such disregard for human safety," she told me.

While Flint's government and its financial struggles certainly have a role to play in the city's water woes, the city may actually be a canary in the coal mine, signaling more problems to come across the country. "Flint is an extreme case, but nationally, there's been a lack of investment in water infrastructure," said Eric Scorsone, an economist at Michigan State University who has followed the case of Flint. "This is a common problem nationally— infrastructure maintenance has not kept up."

Bethany Hazard says her water started coming out of the faucet brown and smelling like a sewer, and when she called the city to complain, she was told the water was fine.

Indeed, water scarcity in the parched West might be getting the most news coverage, but infrastructure delays and climate change are causing big problems for cities in the North and Midwest, too. Last summer, hundreds of thousands of people in Toledo were told not to drink tap water because tests showed abnormally high levels of microcystins, perhaps related to algae blooms in Lake Erie. Microcystins can cause fever, headaches, vomiting, and—in rare cases—seizures. Heavy rainfall has caused backups in the filtering process at overloaded water-treatment plants in Pennsylvania, and so residents are frequently finding themselves under advisories to boil water. And Chicago, which installed lead service lines in many areas in the 1980s, is now facing a spike in lead-contaminated tap water.

In 2013, America received a “D” in the drinking-water category of the American Society for Civil Engineers’ Report Card for America’s Infrastructure. The report found that most of the nation’s drinking-water infrastructure is “nearing the end of its useful life.” Replacing the nation’s pipes would cost more than $1 trillion. The country’s wastewater infrastructure also got a “D” grade.

Hydrant flushing in Flint (Alana Semuels)

Like many cities in America, Flint has lost residents but still has to provide services like water and sewer and road maintenance within the same boundaries. All while bringing in less tax revenue to pay for it. Flint has not had the money to spend on crucial infrastructure upgrades, and has left old pipes in place for longer than most engineers would recommend. Water prices are rising in Flint, like they are in lots of other cities, but the quality of water is getting worse, not better.

Flint has financially struggled for longer than most American cities. The birthplace of General Motors, the city began having problems in the 1980s and 1990s when GM started closing plants. By 2001, its unemployment rate was 11.2 percent, which grew every year until it reached 25 percent in 2009. Families began to seek opportunity elsewhere, leaving behind empty homes. As the city's population declined, it struggled to come up with the revenue to provide basic services such as police and fire coverage for residents. The water system, though, was still a "cash cow," said Scorsone, the professor, so Flint borrowed from the water authority to pay its city bills.

Flint has been buying water from Detroit since 1967. The Detroit Water and Sewer Department, in the booming post-war years, expanded its services, adding 1,000 square miles of territory. But as the population began to shrink in both Detroit and Flint, fewer customers were left to pay for infrastructure and services. Detroit began raising rates, but Flint didn't pass those rate increases on to customers because residents were struggling economically and politicians worried they'd get voted out of office, said Scorsone. That meant that little to no money was spent on infrastructure upgrades.

In 2004, Detroit charged Flint $11.06 per million cubic foot of water. By 2013, it was charging $19.12 per million cubic foot, a 73 percent increase.

"It's a combination of bad management and bad economics," Scorsone said.

Downtown Flint (Carlos Osorio/AP)

By 2011, Flint had a $15 million deficit and Michigan Governor Rick Snyder appointed an emergency manager to take control over the city. It was a move that upset many, since emergency managers are used to replace elected officials such as city councils and mayors and have widespread authority, but less connection to residents. In 2012, Michigan voters repealed an emergency-manager law that had allowed emergency managers to take over troubled cities and school districts. But the state legislature then passed a different, and more far-reaching, emergency-manager law later that year. A group of citizens, including some from Flint, filed a lawsuit arguing that the law violated their constitutional right to equal protection. In November, a judge allowed the suit to go forward.

Unwilling to pay rising Detroit water costs, Genesee County, where Flint is located, decided to work with other Michigan counties to build a pipeline from Lake Huron to mid-Michigan. But the pipeline, called the Karegnondi Water Authority, won't be completed until late 2016. So in 2013, Flint decided that until the pipeline was finished, it would pump water from the Flint River, treat it, and sell it to residents. The plan would save the city much-needed money: The annual cost to treat water from the Flint River is $2.8 million, said Howard Croft, the city's public-works director. Buying water from Detroit, on the other hand, costs $12 million a year.

But making river water safe for public use is a much more difficult task than treating reservoir or lake water. Rivers are subject to runoff and the water quality can change quickly with air temperature or heavy storms. Flint found this out as soon as it turned off the pumps from Detroit and started pumping its own water in April 2014.

Residents said they noticed the difference almost immediately. Melissa Mays says her water started smelling like rotten eggs, and had a strange tint when coming out of the faucet, sometimes blue, sometimes yellowish.

Claire McClinton, a GM retiree, said her house began to smell like garbage. Another resident, Bethany Hazard, says her water started coming out of the faucet brown and smelling like a sewer, and when she called the city to complain, she was told the water was fine.

The water was not fine. First, tests showed there was fecal coliform bacteria in the water, and the city had to issue numerous boil advisories to citizens. In response, engineers upped the amount of chlorine in its water, leading to dangerously high levels of trihalomethanes, or TTHMs, which put Flint in violation of the Clean Water Act. TTHMs are especially dangerous when inhaled, making showering in hot water toxic.

By October, GM, which still has a plant in Flint, had started noticing that the water was corroding parts of its engines. The plant switched off the Flint water, and started trucking in water from elsewhere. It asked the city for permission to use water from Flint Township, rather than the city of Flint (Flint Township was still buying water from Detroit), and switched back to Detroit water, said spokesman Tom Wickham.

LeeAnne Walters didn't notice any changes right away. But a few months after the switch, she noticed that her children were getting rashes between their fingers, on their shins, on the back of their knees. Her four-year-old son, who has a compromised immune system, started breaking out into scaly rashes whenever he swam in their salt-water pool, which he'd used since birth. Then Walters' 14-year-old son got extremely sick and missed a month of school.

So she sent her water off to Marc Edwards, a Virginia Tech environmental engineering professor who had forced the CDC to admit it had misled the public about the amount of lead in D.C.'s water.

Edwards was shocked when he found that Walters' lead content was 13,000 parts per billion. The EPA recommends keeping lead content below 15 parts per billion.

"At first I didn't believe the results because they were the worst I'd ever seen, and I've seen a lot," Edwards told me.

Flint PbCu15-draft tpedits.doc

Liane/Richard/Steve: Thank you for the opportunity to provide input on the LCR letter to Flint. Attached are our suggested edits. I conferred with ORC and we believe that the Federal and Michigan rules allow the State to require specific treatment in lieu of a corrosion control study. Pat Cook asked about this during our last call. Flint would still have to do some monitoring as part of tweaking the treatment in order to optimize it.

Please let me know if you have questions about our comments/suggestions.

Subject: FW: Draft 90th percentile letter

Attached is our draft letter to Flint regarding their lead and copper monitoring results and 90th percentile determination for their initial 2 six-month LCR monitoring periods after the city converted from Detroit's conventional treatment of Lake Huron to softening of the Flint River. This letter includes our directions for the ensuing steps and our recommendations as far as corrosion control optimization.

Please provide any comments you may have by the close of business on Friday, August 14th. We realize this response time is short, but we intend to deliver this letter to the city on Monday, August 17th.

Thanks,

Richard

RICK SNYDER
GOVERNOR

DAN WYANT
DIRECTOR

DRAFT for August 17, 2015

Mr. Brent Wright
City Of Flint - DPW
Flint Water Plant
4500 North Dort Highway
Flint, Michigan 48505

Dear Mr. Wright:

Subject: City Of Flint WSSN: 02310
Lead and Copper Monitoring of Drinking Water Taps

We received your report for the monitoring period January 1, 2015, through June 30, 2015.

Action Levels	Results this monitoring period			
	90th Percentile	# of Samples Above Action Level	# of Samples Required	# of Samples Collected
Lead 15 parts per billion (ppb)	11 ppb	6	60	69
Copper 1.3 parts per million (ppm)	0.16 ppm	0	60	69

Ninety percent or more of the sites you tested are within action levels under the administrative rules promulgated under the Michigan Safe Drinking Water Act, 1976 PA 399, as amended. These results must be reported on your 2015 Consumer Confidence Report (CCR) due to our office, your customers, and the local health department, by July 1, 2016. Also include the following statement in the CCR, regardless of the lead and copper levels:

> *If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The City of Flint is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline at 1-800-426-4791 or at http://water.epa.gov/drink/info/lead.*

Recent changes to the Lead and Copper Rule (LCR) require the water supply to provide individual lead tap results to people who receive water from sites that were sampled, even if lead was not detected, within 30 days of learning of results. You must also send us a certification that you met all the delivery requirements along with a sample copy of your customer notice by 3 months after the end of the monitoring period. To download the *Lead and Copper Report and Consumer Notice of Lead Result Certificate* in Microsoft Word or PDF format, visit http://michigan.gov/deq. Click on Water, Drinking Water, Community Water Supply, and Reporting Forms. Water supplies that fail to distribute the Consumer Notice of Lead Results must include the following statement in their CCR, "During the year, we failed to provide lead results to persons served at the sites that were tested as required by the Lead and Copper Rule."

While the City's LCR compliance monitoring has continued to meet action level requirements, the LCR also requires all large systems (those serving over 50,000 people) to optimize corrosion control regardless of their 90th percentile lead concentration. One way to demonstrate fully optimized corrosion control treatment is through two consecutive six month rounds of LCR compliance monitoring in which the difference between the 90th percentile level and the highest source water lead concentration is less than the Practical Quantitative Level for lead (0.005 mg/l). Since the City of Flint did not meet these criteria in both the July – December 2014, and January – June 2015, sampling periods, the City must now recommend a treatment to fully optimize corrosion control treatment within six months in accordance with requirements under the Michigan Safe Drinking Water Act, Administrative Rule 604f (R 325.10604f). Please provide **this recommendation to our office as soon as possible but no later than December 1, 2015.**

However, given the past use of phosphate treatment by the Detroit Water and Sewerage Department (DWSD) to fully optimize corrosion control treatment when the City of Flint was a wholesale customer of DWSD, this Office is recommending the City consider the selection and recommendation of this treatment option, and begin implementation as soon as possible to address ongoing concerns by customers regarding lead levels within their premise plumbing systems.

We will inform you when monitoring needs to be conducted as part of the optimization of the implemented corrosion control treatment. Customer requested samples for lead shall continue to be collected and analyzed. Please make every attempt to select the same sites used in the previous monitoring period, giving Tier 1 sites first priority. If original sites are unavailable, select replacement sites based on the Tier 1, 2, and 3 criteria.

Please contact me at the number or email listed below at your earliest convenience to discuss how the City will be complying with the above requirements.

Sincerely,

Adam Rosenthal, EQA

Morning folks,

In case you have not seen this website on Flint…14 of 48 samples (30%) are above the lead AL so far. No surprise of course. It just confirms what I have been saying all along about the situation in Flint.

And just in case 'anyone' should ask…no, I have not been involved in this effort. Marc is Marc and God bless him for it.

https://flintwaterstudyupdates.wordpress.com/

Analysis of water samples from 48 Flint homes to date for lead are worrisome

August 27, 2015 Articles

Of the first **48** first draw samples collected by Flint residents and analyzed at VT, **52% were over 5 ppb**, which suggests a serious lead in water problem according to our experience and criteria**.** Fourteen samples (30% of those collected) also exceeded 15 ppb lead, suggesting a very serious lead in water problem. **That is, the Flint Citizen Science study to date, is finding results worse than the EPA standard which is applied to sampling "worst case" homes.** The highest lead sampled in first draw so far was 139 ppb. **The 90th percentile lead level is currently 31 ppb, which is double the EPA standard, and in a range where water consumption can cause lead poisoning in children.**

Subject: Website on Flint

Morning folks,

In case you have not seen this website on Flint…14 of 48 samples (30%) are above the lead AL so far. No surprise of course. It just confirms what I have been saying all along about the situation in Flint.

And just in case 'anyone' should ask…no, I have not been involved in this effort. Marc is Marc and God bless him for it.

Analysis of water samples from 48 Flint homes to date for lead are worrisome

August 27, 2015 Articles

Of the first **48** first draw samples collected by Flint residents and analyzed at VT, **52% were over 5 ppb**, which suggests a serious lead in water problem according to our experience and criteria**.** Fourteen samples (30% of those collected) also exceeded 15 ppb lead, suggesting a very serious lead in water problem. **That is, the Flint Citizen Science study to date, is finding results worse than the EPA standard which is applied to sampling "worst case" homes.** The highest lead sampled in first draw so far was 139 ppb. **The 90th percentile lead level is currently 31 ppb, which is double the EPA standard, and in a range where water consumption can cause lead poisoning in children.**

Hi Jen,

Wasn't sure if Miguel already sent you this link. If not, thought you'd be interested (see below).

Thanks,

Andrea

Tinka/Tim: Mike Schock talks about some of the complications in dealing with lead in the distribution system and the need to have the experts involved in figuring out what needs to be done to the Flint system. It does not sound like it is a simple as turning on an orthophosphate feed pump. Some analytical work will need to be done on the front end. As I mentioned on Friday, Susan's message to the mayor of Flint should stress the need to get the experts involved.

Subject: RE: Flint
Importance: High

Hi, Tom/Miguel;

I know what paper he's referring to, and as usual, there are a lot of competing variables. It's a significant reason why the LCR was intended to require corrosion control studies before making significant treatment changes. For a given set of background water chemistry variables (Cl, NOM, alkalinity , pH, sulfate, etc.), and a given set of plumbing materials, the water system needs to verifiy what water chemistry adjustments need to be made, *together.* I talked to Marc about this issue last week. It is true that in some waters, orthophosphate might aggravate galvanic corrosion, short-term. How long is short and how much aggravation? No way to know. And his experiments use new solder on new copper, which would not (or should never) be the case in Flint. This is another reason why, when there is partial lead service line replacement, regardless of local plumbing codes, *the utility must use dielectric insulators or use plastic replacement pipe.* London, ON, pioneered the latter. I have contact information for them, if it's needed. They have years of experience. The first is a no-brainer, but in most cities, there has not been oversight, so nobody knows if they really did it.

What we do know, and what Marc and I talked about last week, was that *when there are lead service lines present (and Flint has tens of thousands, as far as I know), there are ONLY 2 corrosion control treatment approaches that can work: PbO2 scales, or orthophosphate dosing.* Given the old distribution system, the difficulty in maintaining chlorine residuals, the obvious issues with chlorine reactivity in the water to form DBPs, and the massive iron corrosion and release that has been observed at times, I would guess (without detailed water chemistry characterization) with some confidence that PbO2 scale formation could not be achieved in any reasonable length of time in Flint. It should be a consideration, along with full LSL replacement, as a long-term objective. But I don't think they could achieve the conversion of existing pipe scales without holistically addressing chlorine demand, pH and ORP maintenance issues, plus the unknown of what the during- and post-Detroit water scales were and what the conversion pathway and rate would be to get them to PbO2.

They have too much hardness and too much iron corrosion to even think about raising the pH to the mid-9s to pursue a pH/alkalinity optimization strategy, and with the papers from the last decade showing elevated lead levels in the LSLs of systems with good 90th percentile first draw, first liter results, I think that's not a very promising approach, anyway.

The encouraging thing is that the compilation of over a decade and a half of monitoring at the tap in the UK, where orthophosphate dosing is essentially universal, and they've looked at both LSL and non-LSL sites, is that there's overall improvement by over an order of magnitude, even with non-LSL sites, looking at the data in aggregate. It practice, the mass of lead contamination and exposure potential from the LSLs almost certainly outweigh the old solder issue. Promoting and enforcing the lead-free requirements for brass faucets and in-line devices will also reduce the significance of galvanic corrosion in the future.

The Flint situation calls for a combination of pipe rig-type simulation studies, and perhaps, a partial system isolation demonstration study, like DC did in late summer 2004.. The LCR sampling when they were connected to Detroit, suggests that the phosphate-treated Detroit water did not aggravate galvanic corrosion. That would have been picked up in the 1st L, even with pre-flushed samples. So, they have a new water chemistry situation now, that was not tested before the change, from what I can tell.

Adding orthophosphate to a “dirty” system is not as simple as just turning on a chemical feed. As DC found out (paper attached), alum carry-over can be a complication, undissolved lime from pH adjustment can be a problem, etc. And, severe iron corrosion that exceeds the capability of the orthophosphate to passivate the iron scales. Porous iron scales would necessitate elevated phosphate doses for an extended period of time (months to years), and a period of discolored water may occur during that passivation time, as loose distribution system scales become mobile because of particle surface charge changes. A strong unidirectional flushing problem to clean out corroded iron lines and a long-term O&M plan to keep the distribution system (including storage tanks in the DS) clean enough to improve disinfectant stability and corrosion inhibitor performance.

I’m truly sorry that the system plunged into the expense of building a new plant (rather than remaining connected to the Detroit water) without proper planning and study with respect to corrosion control and metal release implications of the change of water into an old, existing distribution system. It really complicates the cost considerations when comparing staying on the “new” water and fixing the treatment and distribution system issues, versus reconnecting to the Detroit water. And it necessitates some “optimization” studies to mitigate the lead release. Our prior experience with systems from which full profiles of LSL sites by samples from tap to main all point to lead release being generally 3 to 8 times higher than the first-liter samples suggest, when Pb(II) is the form of lead present in the pipe scales. I’m sure it is in Flint. So simply meeting the AL with the current LCR sampling protocol does not assure typical exposures to lead would be low enough to produce minimal impacts on BLLs and cognitive development in the vulnerable population.

Subject: Re: Flint

Yep. That was the paper I had in mind. The solder is one issue wrt galvanic corrosion and the other would be galvanic corrosion after partial LSLR. We have no documentation on LSLs in Flint so I can't characterize the potential scope of the problem with PLSLR. The only information we have on LSLs in Flint is from the folks that put in the new service at the Citizen name / Ex. 6 place and they said that the LSLs they have seen (their experience) have mostly been on the public side (main to curb), but they have seen full LSLs in Flint as well.

If you want, I can see if Mike is available for a call today. Just let me know as soon as you can. I have been up since about 2am and will likely quit early today.

Miguel: Did you see that in the last of Marc's articles on the website that he makes a statement that Flint River water is so corrosive that adding orthophosphate may not help and may make things worse?

"Flint River is very corrosive for iron and lead materials, compared to the water previously purchased from Detroit. Orthophosphates that are commonly added to corrosive waters to minimize lead leaching from aged water distribution pipes made of or containing lead, but water from the Flint River is so corrosive that use of orthophosphate might not provide the normal benefits and might actually make things worse."

One of the links takes you to a paper about phosphates increasing galvanic current between tin and copper, which would affect leaded solder in premise plumbing.

Precipitate Formation in the Distribution System Following Addition of Orthophosphate

Fikremariam Tesfai and Pierre Constant – District of Columbia Water & Sewer Authority (WASA)
Coauthors - Steve Reibier – CH2M Hill, Rich Giani and Maureen Donnelly, WASA

Introduction

Orthophosphate is being used by many water utilities as a metal corrosion inhibitor. The substance binds with metal ions, creating a film on the outer pipe scale to prevent corrosion. After the Washington Aqueduct (WA), the District of Columbia Water and Sewer Authority's (WASA) finished water supplier changed disinfection from free chlorine to chloramines, lead leaching accelerated in the water distribution system. WA began to add phosphoric acid in response to the reported higher lead levels. The initial target residual was 3.2 mg/L phosphate, which WASA intended to maintain until the corrosion control treatment optimized. The 90th percentile lead levels declined from 59 to 15 ppb within eight months of phosphate addition.

WASA began to receive customer complaints of white cloudy water after a year of continuous phosphate treatment. Water Quality technicians collected and tested water samples from taps and hydrants in response to these complaints. Several hydrant samples had a white cloudy appearance and $\text{color}_{\text{apparent}}$ exceeding 200 Pt-Co units. Significant higher levels of phosphate, iron, and aluminum were also measured in these hydrant samples. Filtering the hydrant samples showed nearly all the iron and aluminum and a majority of the phosphate were in particulate form. Interestingly, technicians rarely captured this cloudy appearance inside tap samples. WASA conducted a study, involving field and bench-scale analyses, to determine the cause of the white cloudy water.

Theory

In distribution systems, aluminum, calcium, ferrous and ferric ions can react with various anions and negative-charged organic matter to form precipitates, complex ions and/or coagulate, which may lead to flocculation (Kemmer et al; Miller et al; Lente et al). All mechanisms are observed in most systems. The degree in which one mechanism predominates over another depends on all other cations and anions present, pH, alkalinity, and temperature (Lytle et al).

WA's addition of phosphate into the water supply increased the potential for phosphate to influence particulate formation. Past research has shown that phosphate can release minerals from corrosion layers, decrease bacterial adhesion, form precipitates, and adsorb onto metal oxides, hydroxides, and/or other products (Appenzeller et al; Lytle et al; Magnuson et al; EPA, 2000).

The following paragraphs outline some theoretical particulates and colloids formed from aluminum, calcium and iron; which are known to increase $\text{color}_{\text{apparent}}$ readings and tend to give a white cloudy appearance. In each section, phosphate particulate formation with each metal is discussed.

Aluminum Formations Aluminum precipitation and coagulation are important reactions within wastewater and drinking water treatment. Aluminum salt addition to raw water and wastewater allows aluminum to react with phosphates to form aluminum phosphate and aluminum hydroxides (Haas et al). When enough aluminum salt is added to raw water to neutralize the negatively charged particulates and colloids present, coagulation begins. If the appropriate mixing energy is then applied, flocculation proceeds. The flocs formed are later removed, however this removal is not absolute and a small amount of aluminum salts usually leaves the treatment plant. The formations of crystalline aluminum phosphate and aluminum hydroxide solids are competing reactions and can be given the generalized formula $Al(PO_4)_3(OH)_{3-x}$ (Haas et al). In low phosphate concentrations (<10ppm) the competition is more

2006 © American Water Works Association WQTC Conference All Rights Reserved

significant and will lead to an amorphous collection of particulates and colloids (Yeoman et al.) The amount of amorphous particulates and colloids produced depends on phosphate concentration and pH.

Calcium Formations Calcium is usually the major metal present in semi-hard to hard water distribution systems. Particulate formation is often influenced and/or involved with this cation. The primary precipitate is the crystalline solid, calcium carbonate. Langlier Saturation Index is often used to characterize water's tendency to form this solid. This formula relates temperature, moles of calcium, pH and alkalinity to the formation of calcium carbonate.

Independent of calcium carbonate formation is the precipitation of calcium phosphate particulates or colloids by the formation of apatites (e.g. $CaHPO_4$; $Ca_4H(PO_4)_3$; $Ca_3(PO_4)_2$) or hydroxyl apatite ($Ca_5(PO_4)_3OH$ (Haas et al). This particulate is usually seen in higher pH ranges around 9 and once formed can re-dissolve, if pH is around 7.0 and phosphorus concentration is less than 3ppm (Haas et al).

Iron Formations Ferric and ferrous ions are known to form many particulates and deposits within distribution systems (i.e. goethite, magnetite, lepidocrocite, ferrihyrdrite) (Vikesland et al). An oxidant used for microbiological disinfection in distribution systems will oxidize most ferrous ions in solution to ferric ions. This oxidation reaction is autocatalytic and is also accelerated by the presence and/or formation of iron oxides. The kinetics of ferrous ion oxidation and influence of dissolved oxygen, a weak oxidant, will influence the physical characteristics of ferric particulates formed.

Once ferric ions are formed, they will react with alkalinity and/or phosphate to form insoluble precipitates. These particulates can be generalized by the equation:

$$wPO_4^{3-} + xFe^{3+} + yOH^- \leftrightarrow Fe_x(PO_4)_w(OH)_y^{(3x-3w-y)}$$

Iron phosphate and iron hydroxide formation are competing reactions and are dependent on pH, alkalinity, and phosphate concentration. If more ferric than phosphate ions are present the formation of ferric hydr(oxide) and positively charged complex ions will predominate. Conversely, if more phosphate ions than ferric ions are present the formation of ferric phosphates and negatively-charged ions will predominate. This process, unlike coagulation (mechanism that would proceed if more ferric hydroxides are formed), allows for the formation of negatively charged particles. These products will repel each other thereby making it easy to re-suspend and/or keep them in suspension.

Sources of Al, Ca, Iron, and phosphate in WASA's distribution system

The sources of metal cations and anions within a distribution system can be found in the source water, treatment chemicals added at the plant, and pipe and pipe-scale dissolution. WASA's distribution system iron sources are limited to the piping dissolution and corrosion layer deposits, since no iron salts are used in drinking water treatment. These two sources are significant considering the high percentage of cast iron piping in the distribution system. For aluminum, typical sources are alum and poly-aluminum chloride added at the water treatment plant. Calcium sources are more varied than the other metals, since calcium is found in natural raw water, added at the treatment plant in the form of lime, and incorporated in pipe scale layers. Phosphate is primarily from the phosphoric acid addition at the treatment plant.

This paper outlines the investigation of the white cloudy water phenomena within WASA's distribution system. WASA conducted field analyses to determine the extent of the problem and gather current data. Further bench-scale experiments were performed to characterize the physical properties of the aluminum, calcium, iron, and phosphate interactions under WASA's typical conditions. Bench-scale particulate volume measuring and settling tests were also performed. X-ray diffraction with computer modeling of laboratory formulated and field precipitates are presented to further describe, compare, and identify the major elemental species that contribute to this white cloudy water.

Procedures

Field Sampling

A field sampling plan was developed from three distribution system zones[1] that incorporated white cloudy characteristics. Within two zones, the distribution location with the highest $\text{color}_{\text{apparent}}$ sample was targeted for Scanning Electron Microscopy (SEM) and Electron Detector System (EDS) analysis conducted by the University of Washington. The sampling method was to collect a sample from a hydrant after flushing for 15 minutes at a rate of 250 gpm. Flushing at this flow rate and time allows for cleaning of the hydrant line while also collecting loose debris in the main. Individual constituents were analyzed using HACH methods. Correlation attempts were then made to determine each constituent's effect on apparent color.

Scanning Electron Microscopy (SEM) was employed in an attempt to identify any distinct mineralogical or crystallographic forms within the precipitate mass captured in the field sampling program. The solid precipitates were captured and concentrated on nitro cellulose filters (0.45 micron). This analysis was conducted at the University of Washington using a JEOL 4800 LV SEM system with an EDAX module.. In order to enhance the imaging capability of the instrument and avoid surface charging, the filtered specimens were sputter coated with gold. However, even given this precaution it was impossible to identify any distinct morphologic forms within the precipitate filter cake. The macroscopic character of the collected particles was largely indistinguishable, consisting entirely of amorphous (non-crystalline) particulate matter.

The Energy Dispersive X-ray Spectrometer (EDS) analysis was conducted utilizing a diffractometer producing Copper K-alpha (K_a) radiation controlled by manufacturer supplied software. This analytical technique could successfully determine both the elemental atomic distribution of the filtered precipitates, as well as respective elemental mass distribution.

Bench Scale Testing

Bench-scale experiments evaluated metal salt formations within typical WASA distribution water. Aluminum, calcium, and iron interactions from typical to elevated levels[2] of phosphate were investigated with several batch experiments. Each batch reactor consisted of a 1000 ml beaker, a variable speed mixer, and stir bar. Stock solutions of orthophosphate, aluminum, calcium, and iron were prepared from 60% phosphoric acid, aluminum sulfate solution, calcium chloride solid and ferric chloride solid, respectively.

The tap water used for all experiments was drawn from the entry point containing approximately 3.2 mg/L of phosphate as PO_4. Four batch reactions were conducted, each batch containing a different constituents; aluminum, calcium, iron and phosphate. Each constituent was added at incremental concentrations to the batch reactors. Lime or potassium hydroxide was added for pH adjustment when necessary to maintain a pH of 7.5, equivalent to average pH levels found in WASA's distribution system.

After each chemical addition, the mixture was stirred at 10 rpm for 2 minutes, then reduced to 2 rpm to minimize floc breakup. Slow mixing continued for approximately 30 minutes. Samples were drawn while the mixture was stirring. $\text{Color}_{\text{apparent}}$, pH, and the relevant metals were measured.

All water samples were analyzed using a HACH 890 colorimeter, reagents, and procedures. Each reactor was observed and analyzed after each metal addition and at a final 24-hour retention time.

---

[1] Zones are grouped by water usage and pressure within the distribution system

[2] These residual level amount was taken from the review of historical data of distribution system and identifying the highest value recorded.

2006 © American Water Works Association WQTC Conference All Rights Reserved

Additionally, a separate series of experiments are presented under the section: Evaluation of Iron Phosphate Formation. This series of experiments was performed to visually evaluate ferric particulate formation under three conditions; de-ionized water, tap water, and tap water plus elevated phosphate

Experimental overview

Scenario I. Evaluation of Aluminum Phosphate interaction in color$_{apparent}$ development

Aluminum addition

Incremental doses of 0.1 ppm of Al^{3+} to reach a maximum cumulative dose of 0.6 ppm were added to entry point tap water with a phosphate residual of 3.5 mg/L as PO_4.

Scenario II: Evaluation of Calcium Phosphate interaction in color$_{apparent}$ development

Calcium addition

The Langlier Saturation Index (LSI) of the distribution system water was calculated, to maintain the LSI value below the threshold value for which calcium carbonate precipitation begins. Therefore, Calcium chloride solution was added at 25 ppm Ca^{2+} per increment, and the final value was 213 ppm Ca^{2+}. Additions of HCl and KOH solutions were added to keep pH at approximately 7.6.

Scenario III: Evaluation of Iron Phosphate interaction in color$_{apparent}$ development

1. **Iron addition**

   Ferric chloride was added in increments of 0.20 ppm Fe^{+3} to a final cumulative concentration of 1.88 ppm. Orthophosphate was kept at constant value of 3.5 ppm. To correct the drop in pH, lime solution was added to increase the pH to 7.5. To account for the lime imparting color, a lime blank was developed.

2. **Constant Fe^{3+} ion concentrations in three environment**

   HACH Iron standard solution (ferrous sulfate dissolved in an acidic medium) was added to three 300 ml glass reactors—two with distribution system water and one with de-ionized water. The final iron concentration for each reactor was approximately 2.30 mg/L. Phosphate standard solution was added to increase the concentration of orthophosphate to 11.8 mg/L. To oxidize ferrous ion to ferric ion, 2 ml of sodium hypochlorite (15%) (1200 mg/L) was added to the mixture. The pH of the mixture was maintained at 7.0 – 8.0 with addition of potassium hydroxide.

   The mixing of this experiment differed from the others. The mixture was stirred at 8 rpm for 2 minutes, then reduced to 2 rpm for approximately 30 minutes. The mixture was measured for iron, phosphate, pH, and color$_{apparent}$ readings, after a 24-hour reaction period.

Table 1. Summary of various batch experiments scenarios

Scenario	Experiment	Al, mg/L	Fe, mg/L	PO4, mg/L	Ca, mg/L
I. Aluminum-Phosphate interaction	1.Orthophosphate addition	0.406	-	3.2 - 16.0	-
	2.Aluminum addition	0 - 0.6	-	3.2	-
II. Calcium-Phosphate Interaction	1.Orthophosphate addition	-	-	2.8 – 6.8	175
	2.Calcium addition	-	-	3.8	113 - 238
III. Iron-phosphate Interaction	1.Iron addition	-	0.1 - 1.88	3.5	-
	2.Phosphate addition	-	2.3	3.5 - 11.8	-

Table 2. Initial tap water quality

PO4, mg/L	Al, mg/L	Color	Fe, mg/L	pH	Temp
3.2	0.000	0	0.02	7.56	18.9

Floc Volume Measurements

Additional bench-scale experiments were conducted to quantify the particulate or floc formed under varying phosphate doses and fixed concentration of iron, aluminum, and calcium. An Imhoff cone was used to quantify the volume of precipitate formed. Floc volume was measured in mL/L at intervals of 24, 40, 46, and 106 hours. A summary of metal and phosphate concentrations added is located in Table 3.

Experiment 1 Floc volume measured due to ferric-phosphate interaction

Ferric chloride was added to each beaker, producing 2.0-mg/L ferric. Phosphate addition varied from 2.6 to 20.0 mg/L among the five beakers.

Experiment 2. Floc volume measured due to aluminum -ferric-phosphate interaction

The same procedure was followed as in experiment 1 with the addition of 0.7 mg/L aluminum.

Experiment 3. Floc volume measured due to calcium -ferric-phosphate interaction.

The same procedure was followed as experiment 1, with the addition of 230 mg/L calcium.

Table 3. Summary of experimental conditions in measuring floc volume

Experiment	Fe, mg/L	PO4, mg/L	Al, mg/L	Ca, mg/L	Time intervals in floc measurement, hrs
Ferric-phosphate interaction	2.0	2.6 – 20.0	-	-	24, 40, 46 & 106
Aluminum - ferric-phosphate interaction	2.0	2.6 – 20.0	0.7	-	24, 40, 46 & 106
Calcium -ferric-phosphate interaction	2.0	2.6-20.0	-	230	24, 40, 46 & 106

RESULTS AND DISCUSSION

FIELD DATA ANALYSIS AND INTERPRETATION

Scanning Electron Microscope (SEM) and Electron Detector System (EDS) analysis of particulates from distribution system with cloudy water

Cloudy water samples collected from the two highest apparent color locations in the distribution system were filtered with 0.45 micron filter paper. The collected particulates were analyzed using SEM method. The spectra of the constituent elements are tabulated in Tables 4 and 5 and Figures 1.1 and 1.2.

Table 4. Percentage composition of precipitates of cloudy water in distribution 1

Distribution 1 (H1)	Element	N	F	Na	Mg	Al	Si	P	S	Cl	K	Ca	Fe	Cu
Spectra	Wt %	6.53	4.11	1.08	6.50	6.11	1.77	6.13	0.79	0.72	0.54	49.69	14.74	0.61
	At%	15.23	7.07	1.54	8.74	7.40	2.06	6.47	0.80	0.67	0.45	40.52	8.63	0.31

Table 5: Percentage composition of precipitates of cloudy water in distribution 2

Distribution 2 (H2)	Element	N	F	Na	Mg	Al	Si	P	S	Cl	K	Ca	Fe	Cu	Pb
Spectra	Wt %	5.91	5.20	0.00	8.47	9.27	1.43	8.45	0.41	0.28	0.23	50.51	8.49	0.86	0.49
	At%	13.32	8.64	0.00	11.00	10.85	1.61	8.62	0.41	0.25	0.18	39.81	4.8	0.43	0.08

Fig 1.1 Percentage composition of particulates in distribution zone 1

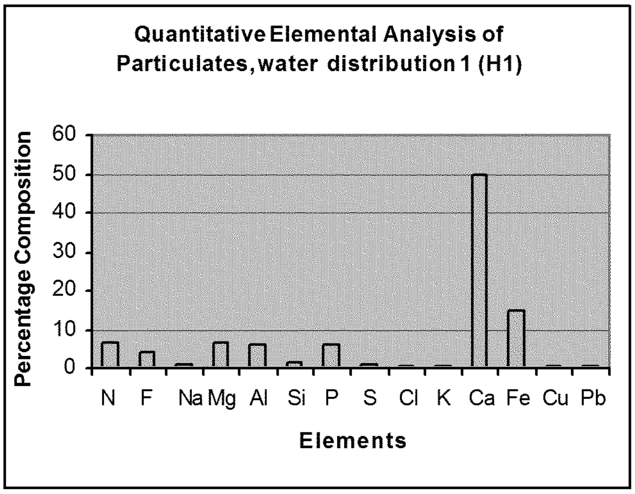

Fig 1.2. Percentage composition of particulates in distribution zone 2

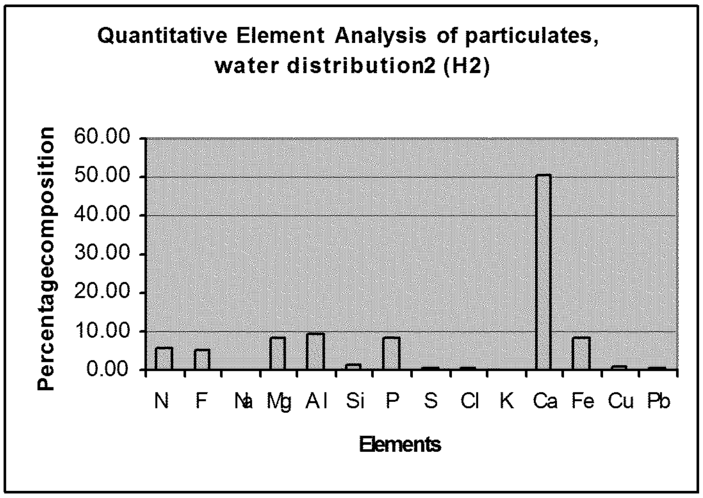

As shown in the graphs, the percentage composition of the water samples from two distribution sites is very similar. The elemental percentage composition of the particulates shows the predominance of calcium (40% –50%); moreover, aluminum, iron, and phosphorus constitute a major part of the particulates.

Individual Constituents vs. Apparent Color

WASA collected and analyzed hydrant samples from three different zones in the distribution system where white cloudy water was previously observed. All field samples collected for this analysis had a white cloudy appearance. Data were analyzed by area (or zone) to show if various phosphate compounds versus $color_{apparent}$ relationships differ within the distribution system and if an individual constituent had a strong correlation.

2006 © American Water Works Association WQTC Conference All Rights Reserved

Aluminum and iron measured in the analyzed zones are expressed in the following figures as total aluminum phosphate and total iron phosphate to demonstrate metal phosphate particulate. This was done based on empirical formulas and the assumption that the metal reacted with the phosphate and was the limiting reactant. Calcium precipitate is the difference between total Ca^{2+} value measured in solution and Ca^{2+} value in the filtrate.

Distribution Zone #1

As iron, aluminum, phosphate and calcium precipitate increased, $color_{apparent}$ was observed to increase.

In all the hydrant zones, the correlation between $\text{color}_{\text{apparent}}$ and phosphate was consistently strong. In addition, ferric and calcium were similar to phosphate R-squared values. This suggests that these two metals may be the major constituents that interact with phosphate to form a precipitate. Aluminum also appears to increase as color increases although the correlation is much weaker.

Overall, average trends appear to indicate that these metal's interaction with phosphate are all involved in cloudy color development.

Bench Scale Experimental Results

I. Results of Metal Phosphate Batch Experimentation

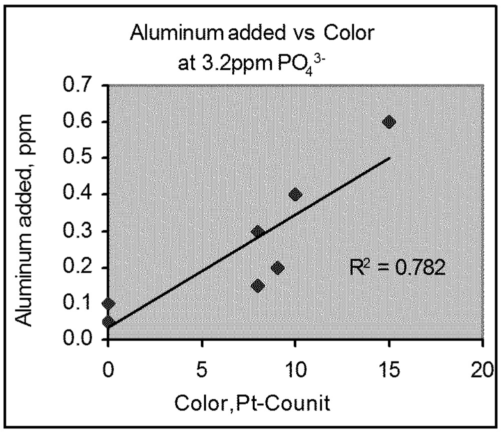
Scenario I. Aluminum and phosphate interaction in particulate formation

Aluminum addition to water with 3.2 mg/L orthophosphate

Figure 4 shows that as phosphate increases, $\text{color}_{\text{apparent}}$ increases, though the linear regression value is only 0.782. $\text{Color}_{\text{apparent}}$ values were extremely low in the bench scale test compared to $\text{Color}_{\text{apparent}}$ values found in the distribution zones

Figure 4.

Aluminum addition

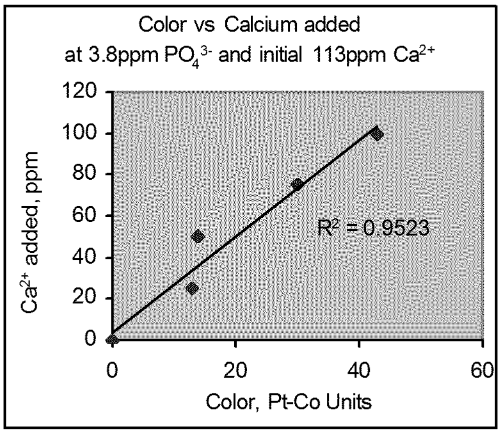


Scenario II. Calcium and phosphate interaction in color formation

Calcium addition to water with phosphate levels of 3.8 mg/L

Figure 5 displays a maximum $\text{Color}_{\text{apparent}}$ value of 43 Pt-Co units with $\text{Color}_{\text{apparent}}$ values increasing as calcium hardness increases. This graph illustrates similar trends compared to the distribution analysis conducted in Figures 1.2, 2.2 and 3.2, in which, $\text{color}_{\text{apparent}}$ values appear to be a function of calcium concentration.

Figure 5.
Calcium addition



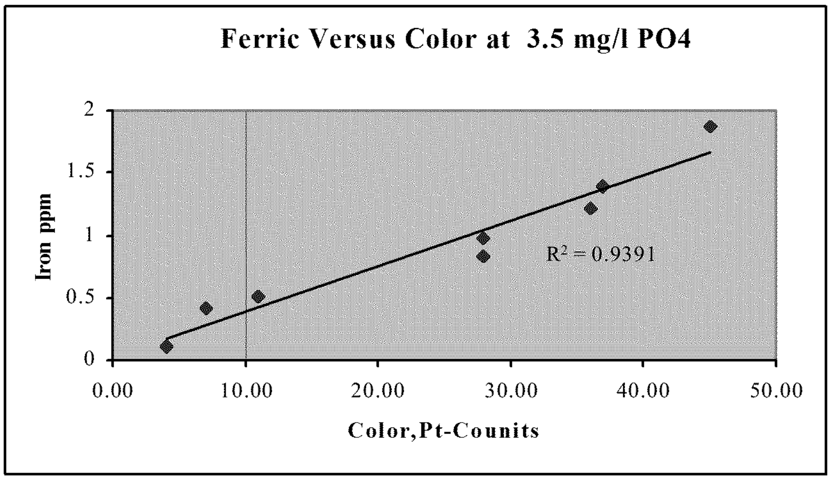
Observations of batch reactors after the 24hr-holding period showed almost no particles had settled.

Scenario III: Iron addition to tap water with phosphate

1. Iron addition to water with 3.5 mg/L orthophosphate

This experiment was done under controlled pH. The pH of the water was maintained around 7.5 with the addition of lime. It was observed that cloudy flocs were formed, and the results show that $\text{color}_{\text{apparent}}$ progressively rose as the concentration of iron increased.

Figure 6.
As the concentration of ferric increases, $\text{color}_{\text{apparent}}$ increases.



In harmony with field data of cloudy water from the distribution system, this bench scale experiment further shows that iron-phosphate interaction could cause formations of particulates to make the water cloudy. Moreover, noticeable amount of particles of a light brown hue settled at the bottom.

2. Constant Fe^{3+} ion concentrations in three environment conditions

To further investigate iron particulate formation, a bench scale experiment was conducted for iron under three conditions (see Table 6). This experiment showed a change of particulate appearance when phosphate levels were changed. Experiment A is a ferric oxide particulate

2006 © American Water Works Association WQTC Conference All Rights Reserved

and experiment C is predominately ferric phosphate. These results suggest that changing phosphate concentration changes particulate appearance.

Table 6. Appearance of particulates changes as the concentration of phosphate changes

Experiment	**A**	**B**	**C**
Conditions	De-ionized water + Iron	Tap water + Iron	Tap Water + Iron + Phosphate
Ferric Iron, mg/L	2.29	2.30	2.21
PO_4, mg/L	0.07	3.50	11.80
Ferrous (dissolved) Iron mg/L	0.03	0.02	0.08
PO_4, dissolved, mg/L	0.06	1.02	1.45
$\text{color}_{\text{apparent}}$, Pt-Co	81	57	79
Particulate phosphate %	0	70	87.7
Total Chlorine - Chloramines	0	3.2 mg/L	3.2 mg/L
Visual observations	Orange brown	light brown	White cloudy

Experiment A (DI +iron) produced colloids, brown in color most likely ferric hydroxide. However, experiment B (3.5 mg/L phosphate + iron) produced colloids that were lighter brown than colloids formed in experiment A. Analysis of filtered and collected particulates shows that 2.48 mg/L of phosphate (70%) and almost all the iron were incorporated within. In experiment C particulates were cloudier than in experiments A or B. In Experiment C, out of 11.8 mg/L total phosphate only 1.45 mg/L was dissolved, the remaining 87.7 % of the phosphate was in particulate form, and most of the iron (96.4%) was in particulate form. This shows that the flocs, which are cloudy, are mainly composed of iron-phosphate complexes.

II. BENCH SCALE EXPERIMENTS IN MEASURING FLOC VOLUME

Results from floc volume measuring

1. Ferric- Phosphate Interaction and floc formation

It was observed that flocs formed and developed due to the interaction of ferric with phosphate. The sludge volume measured by the Imhoff cone increased as the phosphate concentration increased. Moreover, the floc volume increased as contact time increases indicating that noticeable particulate formation is likely to occur further out near the ends of the distribution system (Figures 7.1 and 7.2).

2006 © American Water Works Association WQTC Conference All Rights Reserved

Fig 7.1
Floc volume increases as phosphate increases at 2.0 mg/L Fe

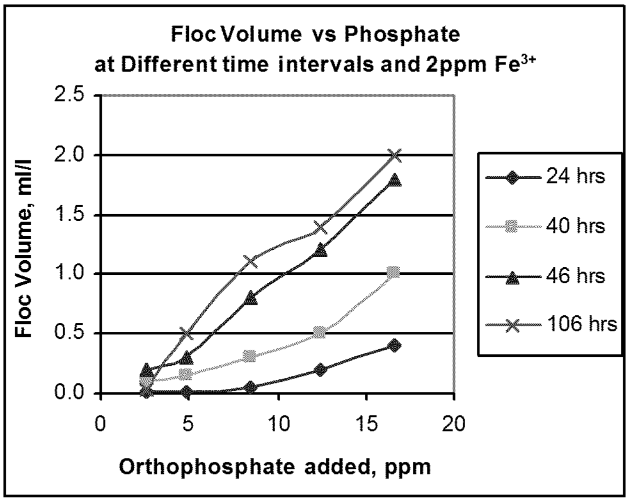


Fig 7.2
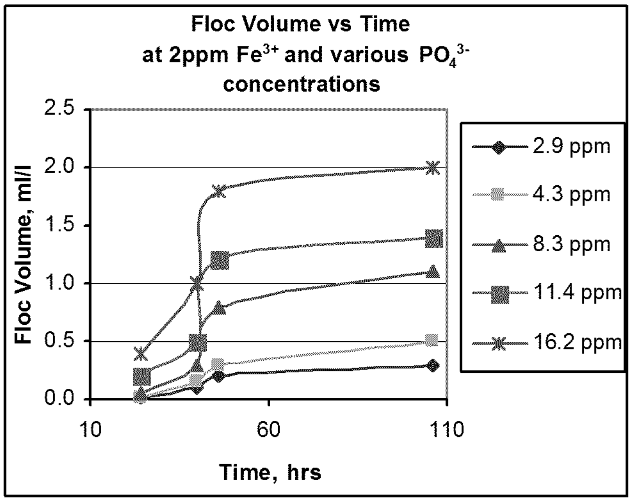
Rate of floc formation is fastest at 24-48 hrs.



It was further observed that the rate of floc formation increased after 24 hours. Initially it takes time for the nucleus of floc to be formed; however once the seed of flocs is formed, the rate of floc growth is relatively fast. The floc formation is considerably higher after 24 hrs contact time and there is no considerable increase in floc formation after 48 hrs of contact time, as can be seen in Fig 7.2.

2. Aluminum-Ferric-Phosphate interaction and floc formation

The introduction of 0.7 mg/L aluminum resulted in an increase in floc volume compared with the floc volume formed by interaction of only ferric-phosphate. Aluminum may play a role in enhancing ferric-phosphate interaction in floc formation.

Fig 8.1
Floc volume increases as PO_4 increases at 0.7 ppm Al and 2.0ppm Fe

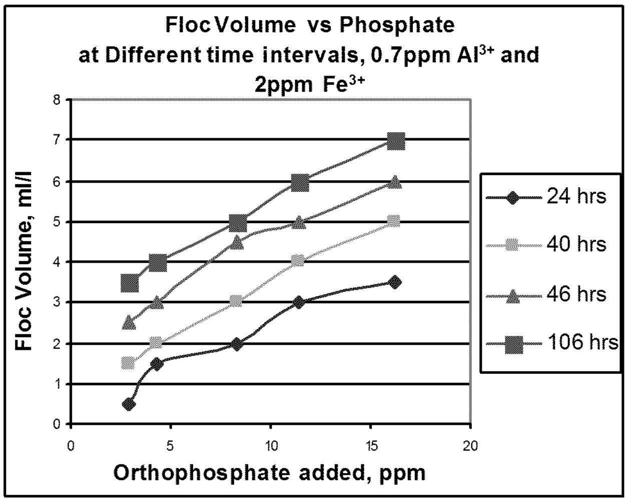


Fig 8.2
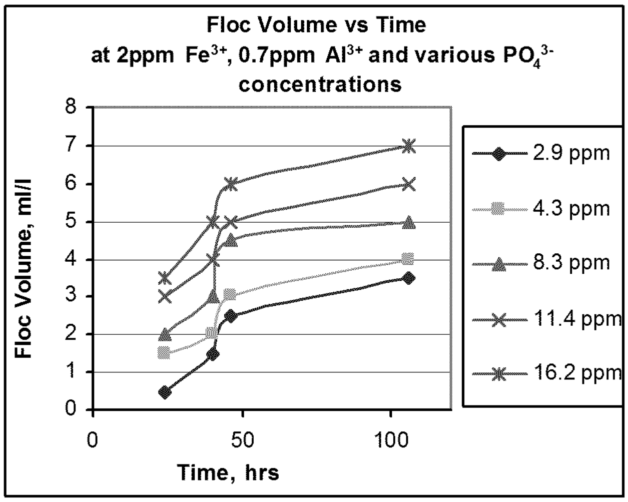
Rate of floc formation is fastest 24-48 hrs



.

The rate of floc formation is similar as in ferric-phosphate interaction. Floc formation is considerably high at 24 - 48 hrs of contact time.

2006 © American Water Works Association WQTC Conference All Rights Reserved

3. Calcium-Ferric-Phosphate interaction and floc formation

Similar to the ferric-phosphate experiment, floc formation increased over time producing similar floc volumes. However, increasing concentrations of phosphate seem to have little effect on sludge development in the presence of calcium. This was unexpected and yielded different results compared to batch experiment Scenario II where mixing calcium and phosphate yielded increasing color. However, $\text{color}_{\text{apparent}}$ is not a true measurement of precipitation formation and is not related to the amount of settled precipitate as measured in the Imhoff apparatus. High color and low settled floc volumes may indicate that the floc that formed under the influence of calcium has a tendency to remain in suspension.

Fig 9.1
Floc volume was the same as phosphate increased at 230ppm Ca and 2.0ppm Fe

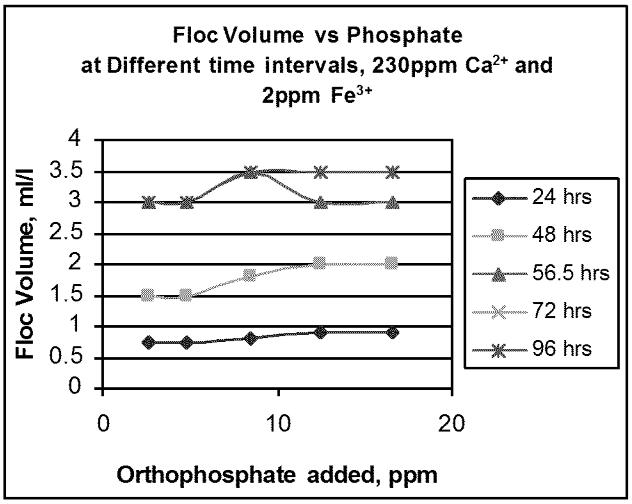


Fig 9.2
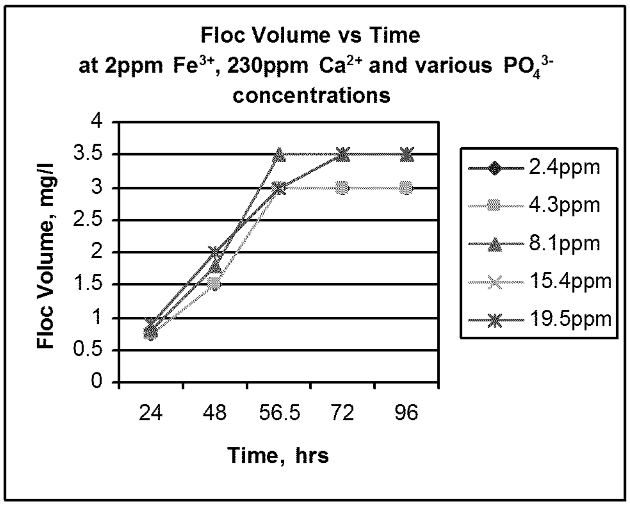
Rate of floc formation is fastest at 48-60 hrs



Conclusions

- High levels of phosphate (3.2 mg/L) in the presence of metal ions formed flocs in the distribution system, which produces the white cloudy appearance. Major constituents found in the particulate consisted primarily of phosphorous, iron, calcium, magnesium and aluminum by weight. However, based on phosphate's greater affinity for iron oxides than all other inorganic or organic anions (Appenzeller et al), it maybe assumed that iron-phosphate interaction plays a more pronounced role in flocs produced in the distribution system than the other metals studied.

- Other metal ions within the distribution can be incorporated within the iron phosphate flocs, influencing particulate characteristics.

- Aluminum may increase floc volume in the presence of ferric-phosphate, although it was not definitive from the data.

- Formation of precipitation in the presence of high calcium and iron concentrations may not be dependent on phosphate concentrations as shown in Figure 9.1. However, Figures 5 and 6 show a direct correlation of increased apparent color as each constituent's concentration was increased in the presence of phosphate, but in the absence of the other constituent.

- Formation of particulate phosphate can be complex in drinking water thus indicating the need for further study with phosphate-metals reactions, particulate formation and characteristics and volume of precipitate formed.

Subject: RE: Flint
Importance: High

Hi, Tom/Miguel;

I know what paper he's referring to, and as usual, there are a lot of competing variables. It's a significant reason why the LCR was intended to require corrosion control studies before making significant treatment changes. For a given set of background water chemistry variables (Cl, NOM, alkalinity , pH, sulfate, etc.), and a given set of plumbing materials, the water system needs to verifiy what water chemistry adjustments need to be made, *together.* I talked to Marc about this issue last week. It is true that in some waters, orthophosphate might aggravate galvanic corrosion, short-term. How long is short and how much aggravation? No way to know. And his experiments use new solder on new copper, which would not (or should never) be the case in Flint. This is another reason why, when there is partial lead service line replacement, regardless of local plumbing codes, *the utility must use dielectric insulators or use plastic replacement pipe.* London, ON, pioneered the latter. I have contact information for them, if it's needed. They have years of experience. The first is a no-brainer, but in most cities, there has not been oversight, so nobody knows if they really did it.

What we do know, and what Marc and I talked about last week, was that *when there are lead service lines present (and Flint has tens of thousands, as far as I know), there are ONLY 2 corrosion control treatment approaches that can work: PbO2 scales, or orthophosphate dosing.* Given the old distribution system, the difficulty in maintaining chlorine residuals, the obvious issues with chlorine reactivity in the water to form DBPs, and the massive iron corrosion and release that has been observed at times, I would guess (without detailed water chemistry characterization) with some confidence that PbO2 scale formation could not be achieved in any reasonable length of time in Flint. It should be a consideration, along with full LSL replacement, as a long-term objective. But I don't think they could achieve the conversion of existing pipe scales without holistically addressing chlorine demand, pH and ORP maintenance issues, plus the unknown of what the during- and post-Detroit water scales were and what the conversion pathway and rate would be to get them to PbO2.

They have too much hardness and too much iron corrosion to even think about raising the pH to the mid-9s to pursue a pH/alkalinity optimization strategy, and with the papers from the last decade showing elevated lead levels in the LSLs of systems with good 90th percentile first draw, first liter results, I think that's not a very promising approach, anyway.

The encouraging thing is that the compilation of over a decade and a half of monitoring at the tap in the UK, where orthophosphate dosing is essentially universal, and they've looked at both LSL and non-LSL sites, is that there's overall improvement by over an order of magnitude, even with non-LSL sites, looking at the data in aggregate. It practice, the mass of lead contamination and exposure potential from the LSLs almost certainly outweigh the old solder issue. Promoting and enforcing the lead-free requirements for brass faucets and in-line devices will also reduce the significance of galvanic corrosion in the future.

The Flint situation calls for a combination of pipe rig-type simulation studies, and perhaps, a partial system isolation demonstration study, like DC did in late summer 2004.. The LCR sampling when they were connected to Detroit, suggests that the phosphate-treated Detroit water did not aggravate galvanic corrosion. That would have been picked up in the 1st L, even with pre-flushed samples. So, they have a new water chemistry situation now, that was not tested before the change, from what I can tell.

Adding orthophosphate to a "dirty" system is not as simple as just turning on a chemical feed. As DC found out (paper attached), alum carry-over can be a complication, undissolved lime from pH adjustment can be a problem, etc. And, severe iron corrosion that exceeds the capability of the orthophosphate to passivate the iron scales. Porous iron scales would necessitate elevated phosphate doses for an extended period of time (months to years), and a period of discolored water may occur during that passivation time, as loose distribution system scales become mobile because of particle surface charge changes. A strong unidirectional flushing problem to clean out corroded iron lines and a long-term O&M plan to keep the distribution system (including storage tanks in the DS) clean enough to improve disinfectant stability and corrosion inhibitor performance.

I'm truly sorry that the system plunged into the expense of building a new plant (rather than remaining connected to the Detroit water) without proper planning and study with respect to corrosion control and metal release implications of the change of water into an old, existing distribution system. It really complicates the cost considerations when comparing staying on the "new" water and fixing the treatment and distribution system issues, versus reconnecting to the Detroit water. And it necessitates some "optimization" studies to mitigate the lead release. Our prior experience with systems from which full profiles of LSL sites by samples from tap to main all point to lead release being generally 3 to 8 times higher than the first-liter samples suggest, when Pb(II) is the form of lead present in the pipe scales. I'm sure it is in Flint. So simply meeting the AL with the current LCR sampling protocol does not assure typical exposures to lead would be low enough to produce minimal impacts on BLLs and cognitive development in the vulnerable population.

Subject: Re: Flint

Yep. That was the paper I had in mind. The solder is one issue wrt galvanic corrosion and the other would be galvanic corrosion after partial LSLR. We have no documentation on LSLs in Flint so I can't characterize the potential scope of the problem with PLSLR. The only information we have on LSLs in Flint is from the folks that put in the new service at the Citizen name / Ex. 6 place and they said that the LSLs they have seen (their experience) have mostly been on the public side (main to curb), but they have seen full LSLs in Flint as well.

If you want, I can see if Mike is available for a call today. Just let me know as soon as you can. I have been up since about 2am and will likely quit early today.

Subject: Flint

Miguel: Did you see that in the last of Marc's articles on the website that he makes a statement that Flint River water is so corrosive that adding orthophosphate may not help and may make things worse?

"Flint River is very corrosive for iron and lead materials, compared to the water previously purchased from Detroit. Orthophosphates that are commonly added to corrosive waters to minimize lead leaching from aged water distribution pipes made of or containing lead, but water from the Flint River is so corrosive that use of orthophosphate might not provide the normal benefits and might actually make things worse."

One of the links takes you to a paper about phosphates increasing galvanic current between tin and copper, which would affect leaded solder in premise plumbing.

Dear Citizen name / Ex. 6

Thank you for your call on Friday.

In follow-up to your inquiry on U.S. EPA lead experts, I had a conversation with Dr. Darren Lytle, who is the Acting Chief of the Treatment Technology Evaluation Branch in the Water Supply and Water Resources Division within EPA's Office of Research and Development. Scientists within Dr. Lytle's branch have expertise in drinking water treatment including corrosion control to address lead contamination. We passed along Dr. Lytle's information to both MDEQ and Flint's Mayor, Dayne Walling, for consideration to work with Flint's Technical Advisory Committee.

You mentioned that you wanted to provide the Flint City Council with this information since Mayor Walling has not shared EPA's assistance offer with the Council. I have left a voicemail message with Councilwoman Monica Galloway regarding your inquiry since it is critical that the Council work with the City and the State to discuss next steps for the Flint Water system.

Please let me know if you have any follow-up questions.

Best wishes,

Heather

Subject: links to update flint water news

Hi All,

Today, activists delivered a petition (with ~27,000 signatures) asking Flint to immediately switch back to Detroit water:

http://www.abc12.com/news/headlines/Crowd-gathers-outside-Flint-City-Hall-demands-switch-to-Detroit-water--323442421.html

And, in case you haven't checked the Marc Edwards Flint site today, there are more Pb results posted:

https://flintwaterstudyupdates.wordpress.com/

"Analysis of water samples from an additional 72 Flint homes are concerning

August 31, 2015 flintwaterstudy Articles

Over the weekend, we analyzed another 72 lead samples collected by Flint residents and mailed to Virginia Tech. For the 120 samples analyzed to date, forty two percent were over 5 ppb, which suggests a serious lead in water problem according to our experience and criteria.

Twenty-three (20% of the 120 samples collected to date) also exceeded the 15 ppb lead action limit. The highest lead sampled in first draw so far was 158 ppb, and the highest sample after 45 second flushing is 1,051 ppb. Six of 120 homes sampled (5%), had over 15 ppb lead even after 2 minutes of continuous flushing.

The 90%'ile lead level in the Flint Water Study is currently 30 ppb, which is double the EPA standard applied to homes with "worst case" lead plumbing, and in a range where water consumption has caused lead poisoning in children and adverse pregnancy outcomes. Needless to say, these data are very worrisome, especially considering that our survey did not target "worst case" lead plumbing systems as is required for EPA sampling.

Look at our summary page here for more details. We just heard that we are approaching the 250 (out of 300) mark of returned kits and we couldn't be more grateful and proud of Flint's citizen scientists. Please continue collecting samples, as larger number of samples helps to draw stronger conclusions. More samples may also help Flint residents understand what regions of the city and the types of plumbing systems that have the most serious lead problems. We are also contacting homes with high lead levels via phone and email and all sampled residents will receive their results via regular mail."

There's also this part about how residents with high results in the first round were called:

"Informing Flint Residents about lead in their water

All Flint residents who returned their lead kits will receive their results via regular mail. You will also receive this document on how to interpret your lead results. For the first 48 lead kits analyzed so far, we have finished calling residents who had considerably high lead in their water. For those we couldn't get through, we left voicemail messages and sent an email."

Thanks,

Andrea Porter

STRATEGIC NEXT STEPS FOR FLINT TO ADDRESS LEAD CORROSION CONCERNS

Tom Poy discussed Marc Edwards' website, "Flint, MI Water Study Updates" (https://flintwaterstudyupdates.wordpress.com/). The discussion focused on the lead sampling and analytical results Marc Edwards' team posted to their website. Tom emphasized that EPA is not involved with Marc Edwards' work in Flint. Tom mentioned that the Edwards team's samples may not have been analyzed by a certified lab (which is only required for compliance samples) nor taken from sites that qualify as Tier 1 for LCR compliance sampling, but the results give further evidence that lead levels in Flint are trending upward. (The conclusion that there is an increasing trend of lead concentrations at consumer taps builds upon earlier compliance sampling taken by Flint in 2014 and 2015 that showed the 90th percentile of the 1st 6-month sampling period at 6ppb, then the 90th percentile of the 2nd 6-month sampling period at 11ppb.)

The "Flint, MI Water Study Updates" website is putting added pressure on MDEQ and EPA to ensure that Flint addresses their lack of optimized corrosion control treatment in an expedited manner in order to protect the residents from exposure to high lead levels. Richard noted that there are numerous systems across the country that have installed corrosion control treatment, have optimized their corrosion control, but continue to have high lead levels. We all acknowledged that this is true, but we all also acknowledged that to delay installation of corrosion control treatment in Flint would likely cause even higher levels of lead over time as Flint's approximately 15,000 lead service lines are continuously in contact with corrosive water.

Region 5 and MDEQ brainstormed on strategic next steps for Flint to address lead corrosion concerns. These steps included:

1. **Public Education for Flint Residents.** Liane has contacted the Department of Community Health to discuss developing a consumer lead education piece outlining the consumer's responsibilities to lower the lead in their drinking water. The Region was glad to hear of a plan to initiate Lead Public Education. The educational material could include steps consumers can take immediately to reduce their exposure to lead in drinking water (flushing their lines after long stagnation periods, using filters certified to remove lead, etc.) as well as longer term fixes to remove lead sources (for example, financing the cost to remove any part of a lead service line on the owner's property at the same time as Flint is replacing its portion of the lead service line).

2. **Gathering Information on Flint's Future Treatment Plans.** Steve Busch said Flint and their engineering consultants were meeting this week (Sept 1) to discuss conceptually the necessary optimized corrosion control treatment at Flint. Tom Poy shared EPA lead experts' (Mike Schock and Darren Lytle of EPA's Office of Research and Development in Cincinnati) caution against simply adding orthophosphate without first studying the water quality and existing distribution system conditions to ensure that any installed treatment has a good chance of working. EPA lead experts have research and field experience showing the complexity of optimizing corrosion control treatment when water quality is significantly changed, as is the case for Flint.

3. **Offering Flint Free Help from EPA Experts.** Steve Busch has already provided the names of EPA lead experts (Mike Schock and Darren Lytle) to Flint, as has Susan Hedman, R5 Administrator. MDEQ and Region 5 agree that, to successfully control lead corrosion in the distribution system, Flint needs to review this situation holistically, while also addressing the lead issue in an expedited manner.

4. **Laying Groundwork for MDEQ/EPA Collaboration with Flint.** If Flint accepts the offer of technical assistance for optimizing corrosion control, Tom Poy suggested that MDEQ and EPA lead experts (Mike Schock and Darren Lytle) form a partnership to provide such help. EPA experts are able to provide pipe scale analyses, as well as other laboratory support. Although Flint (using their consultant) bears the ultimate responsibility for designing and

installing corrosion control, MDEQ and EPA experts are willing and able to provide advice throughout the process.

Hi Jen! This looks good. I think that you do cover some of the work that EPA lead experts could offer.

I thought that it was important to include the messages from Liane and Rich re: not emphasizing optimizing of corrosion control treatment as the "fix"—I think that this is a bumpy unknown road, and most of the time with other contaminants we have more confidence that the treatment will result in reduced exposure, but MDEQ definitely did not think that was necessarily the case, especially in the short term.

STRATEGIC NEXT STEPS FOR FLINT TO ADDRESS LEAD CORROSION CONCERNS

Tom Poy discussed Marc Edwards' website, "Flint, MI Water Study Updates" (https://flintwaterstudyupdates.wordpress.com/). The discussion focused on the lead sampling and analytical results Marc Edwards' team posted to their website. Tom emphasized that EPA is not involved with Marc Edwards' work in Flint. Tom mentioned that the Edwards team's samples may not have been analyzed by a certified lab (which is only required for compliance samples) nor taken from sites that qualify as Tier 1 for LCR compliance sampling, but the results give further evidence that lead levels in Flint are trending upward. (The conclusion that there is an increasing trend of lead concentrations at consumer taps builds upon earlier compliance sampling taken by Flint in 2014 and 2015 that showed the 90th percentile of the 1st 6-month sampling period at 6ppb, then the 90th percentile of the 2nd 6-month sampling period at 11ppb.)

The "Flint, MI Water Study Updates" website is putting added pressure on MDEQ and EPA to ensure that Flint addresses their lack of optimized corrosion control treatment in an expedited manner in order to protect the residents from exposure to high lead levels. Richard noted that there are numerous systems across the country that have installed corrosion control treatment, have optimized their corrosion control, but continue to have high lead levels. We all acknowledged that this is true, but we all also acknowledged that to delay installation of corrosion control treatment in Flint would likely cause even higher levels of lead over time as Flint's approximately 15,000 lead service lines are continuously in contact with corrosive water. However, as further discussed below, Tom also pointed out that we do not want Flint rushing to install treatment that may not be effective.

Region 5 and MDEQ brainstormed on strategic next steps for Flint to address lead corrosion concerns. These steps included:

1. **Public Education for Flint Residents.** Liane has contacted the Department of Community Health to discuss developing a consumer lead education piece outlining the consumer's responsibilities to lower the lead in their drinking water. The Region was glad to hear of a plan to initiate Lead Public Education. (I don't think we necessarily need to add anything here, but do you have any notes on this--It was not really clear from the discussion if this was going to include the required public education language in the reg when a CWs exceeds an AL—I think it should.) The educational material could include steps consumers can take immediately to reduce their exposure to lead in drinking water (flushing their lines after long stagnation periods, using filters certified to remove lead, etc.) as well as longer term fixes to remove lead sources (for example, financing the cost to remove any part of a lead service line on the owner's property at the same time as Flint is replacing its portion of the lead service line). The immediate steps that consumers can take is the critical public health message, since treatment studies, installation and the process of optimizing corrosion control take time and there is no guarantee that these actions will reduce lead below the action level.

2. **Gathering Information on Flint's Future Treatment Plans.** Steve Busch said Flint and their engineering consultants were meeting this week (Sept 1) to discuss conceptually the necessary optimized corrosion control treatment at Flint. Tom Poy shared EPA lead experts' (Mike Schock and Darren Lytle of EPA's Office of Research and Development in Cincinnati) caution against simply adding orthophosphate without first studying the water quality and existing distribution system conditions to ensure that any installed treatment has a good chance of working. EPA lead experts have research and field experience showing the complexity of optimizing corrosion control treatment when water quality is significantly changed, as is the case for Flint.

3. **Offering Flint Free Help from EPA Experts.** Steve Busch has already provided the names of EPA lead experts (Mike Schock and Darren Lytle) to Flint, as has Susan Hedman, R5 Administrator. MDEQ and Region 5 agree that, to successfully control lead corrosion in the distribution system, Flint needs to review this situation holistically, while also addressing the lead issue in an expedited manner. MDEQ will follow-up with Flint regarding a possible call with ORD.

4. **Laying Groundwork for MDEQ/EPA Collaboration with Flint.** If Flint accepts the offer of technical assistance for optimizing corrosion control, Tom Poy suggested that MDEQ and EPA lead experts (Mike Schock and Darren Lytle) form a partnership to provide such help. EPA experts are able to provide pipe scale analyses, as well as other laboratory support. Although Flint (using their consultant) bears the ultimate responsibility for designing and installing corrosion control, MDEQ and EPA experts are willing and able to provide advice throughout the process.

Subject: Re: Notes from our call yesterday with MI DEQ RE: Flint

My thoughts...

ORD partnership - The #1 thing above all else is that we need to push is ORD support to help Flint solve the problem asap and to provide guidance to MDEQ on preventing 20 more Flints from happening. Mike/Darren are folks I would want on my team if I were trying to navigate a mess like Flint. ORD always works closely with the primacy agency whenever they provide support to any public water system, state or region and there have never been any issues with that.

Concurrently, PE in Flint is an absolute must right now since there will be no quick fix for the lead problems. The lead values on the Virginia Tech website are very alarming, since these are random sites (with and without lead lines). Most of the lead lines in Flint are from the water main to the property line, so most of the lead is coming from the utility side, not the homeowners' side. The lack of treatment and the chloride levels are also likely increasing the dissolution of leaded solder inside the homes, since Flint is not treating the water adequately. As such, I think Flint has an obligation here beyond compliance. According to the contractor that replaced the Citizen name / Ex. 6 service line, the City of Flint has records on the lead lines, so that should be made available to the public so that they can protect their families.

Lab Certification - The lab certification issue is a non-issue and Marc's group is very likely using a better protocol than the EPA-approved EPA with respect to capturing particulate lead which is a significant issue in Flint. I have peer-reviewed papers from many folks at VT and their methodologies are always scientifically sound. The only thing missing is a piece of paper that says they are following the methods. I would recommend that MDEQ not make a point of that, since it lacks any scientific merit.

On DEQ comments on treatment optimization...

While it is true that many (actually it should say 'most') systems with lead lines install treatment and still have high lead, it is because we have learned that it is not possible to control lead release with treatment alone because of:

chronic lower water use homes

lead lines being disturbed every day

homes that were unoccupied for extended periods becoming reoccupied

galvanic corrosion due to partial LSL replacement and no use of dielectric connectors

etc.

These problems are made worse overall (nationally) because systems do not optimize their corrosion control treatment. AWWA acknowledged this during the NDWAC meeting, saying that 60-70 percent of systems they studied that are in compliance right now do not meet the lead action level based on lead service line samples. While that is not the compliance sampling protocol right now, it just shows you that they are not treating to minimize lead, they are treating to meet the lead action level based on first-draw (and in the case of MI systems, pre-flushed first-draw) samples and that is inadequate treatment. When something goes wrong or changes are made, a system can easily exceed the lead action level (unless they are pre-flushing and/or gaming the site selection and/or throwing out valid samples).

Just FYI on the certified lab issue...

ORD's lab is not certified, so all of their public research is done using a non-certified lab. So if DEQ is pointing out that the VT data is not from a certified lab, keep in mind that we are pushing for them to work with ORD and their non-certified lab. Excellent research, valid analytical data, just not certified. Same as VT.

The discussion focused on the lead sampling and analytical results Marc Edwards' team posted to their website. Tom emphasized that EPA is not involved with Marc Edwards' work in Flint. Tom mentioned that the Edwards team's samples may not have been analyzed by a certified lab (which is only required for compliance samples) nor taken from sites that qualify as Tier 1 for LCR compliance sampling, but the results give further evidence that lead levels in Flint are trending upward. (The conclusion that there is an increasing trend of lead concentrations at consumer taps builds upon earlier compliance sampling taken by Flint in 2014 and 2015 that showed the 90th percentile of the 1st 6-month sampling period at 6ppb, then the 90th percentile of the 2nd 6-month sampling period at 11ppb.)

The “Flint, MI Water Study Updates” website is putting added pressure on MDEQ and EPA to ensure that Flint addresses their lack of optimized corrosion control treatment in an expedited manner in order to protect the residents from exposure to high lead levels. Richard noted that there are numerous systems across the country that have installed corrosion control treatment, have optimized their corrosion control, but continue to have high lead levels. We all acknowledged that this is true, but we all also acknowledged that to delay installation of corrosion control treatment in Flint would likely cause even higher levels of lead over time as Flint’s approximately 15,000 lead service lines are continuously in contact with corrosive water.

Region 5 and MDEQ brainstormed on strategic next steps for Flint to address lead corrosion concerns. These steps included:

1. **Public Education for Flint Residents.** Liane has contacted the Department of Community Health to discuss developing a consumer lead education piece outlining the consumer’s responsibilities to lower the lead in their drinking water. The Region was glad to hear of a plan to initiate Lead Public Education. The educational material could include steps consumers can take immediately to reduce their exposure to lead in drinking water (flushing their lines after long stagnation periods, using filters certified to remove lead, etc.) as well as longer term fixes to remove lead sources (for example, financing the cost to remove any part of a lead service line on the owner’s property at the same time as Flint is replacing its portion of the lead service line).

2. **Gathering Information on Flint’s Future Treatment Plans.** Steve Busch said Flint and their engineering consultants were meeting this week (Sept 1) to discuss conceptually the necessary optimized corrosion control treatment at Flint. Tom Poy shared EPA lead experts’ (Mike Schock and Darren Lytle of EPA’s Office of Research and Development in Cincinnati) caution against simply adding orthophosphate without first studying the water quality and existing distribution system conditions to ensure that any installed treatment has a good chance of working. EPA lead experts have research and field experience showing the complexity of optimizing corrosion control treatment when water quality is significantly changed, as is the case for Flint.

3. **Offering Flint Free Help from EPA Experts.** Steve Busch has already provided the names of EPA lead experts (Mike Schock and Darren Lytle) to Flint, as has Susan Hedman, R5 Administrator. MDEQ and Region 5 agree that, to successfully control lead corrosion in the distribution system, Flint needs to review this situation holistically, while also addressing the lead issue in an expedited manner.

4. **Laying Groundwork for MDEQ/EPA Collaboration with Flint.** If Flint accepts the offer of technical assistance for optimizing corrosion control, Tom Poy suggested that MDEQ and EPA lead experts (Mike Schock and Darren Lytle) form a partnership to provide such help. EPA experts are able to provide pipe scale analyses, as well as other laboratory support. Although Flint (using their consultant) bears the ultimate responsibility for designing and installing corrosion control, MDEQ and EPA experts are willing and able to provide advice throughout the

process.

Just FYI on the certified lab issue...

ORD's lab is not certified, so all of their public research is done using a non-certified lab. So if DEQ is pointing out that the VT data is not from a certified lab, keep in mind that we are pushing for them to work with ORD and their non-certified lab. Excellent research, valid analytical data, just not certified. Same as VT.

Subject: Re: Notes from our call yesterday with MI DEQ RE: Flint

My thoughts...

ORD partnership - The #1 thing above all else is that we need to push is ORD support to help Flint solve the problem asap and to provide guidance to MDEQ on preventing 20 more Flints from happening. Mike/Darren are folks I would want on my team if I were trying to navigate a mess like Flint. ORD always works closely with the primacy agency whenever they provide support to any public water system, state or region and there have never been any issues with that.

Concurrently, PE in Flint is an absolute must right now since there will be no quick fix for the lead problems. The lead values on the Virginia Tech website are very alarming, since these are random sites (with and without lead lines). Most of the lead lines in Flint are from the water main to the property line, so most of the lead is coming from the utility side, not the homeowners' side. The lack of treatment and the chloride levels are also likely increasing the dissolution of leaded solder inside the homes, since Flint is not treating the water adequately. As such, I think Flint has an obligation here beyond compliance. According to the contractor that replaced the Citizen name / Ex. 6 ervice line, the City of Flint has records on the lead lines, so that should be made available to the public so that they can protect their families.

Lab Certification - The lab certification issue is a non-issue and Marc's group is very likely using a better protocol than the EPA-approved EPA with respect to capturing particulate lead which is a significant issue in Flint. I have peer-reviewed papers from many folks at VT and their methodologies are always scientifically sound. The only thing missing is a piece of paper that says they are following the methods. I would recommend that MDEQ not make a point of that, since it lacks any scientific merit.

On DEQ comments on treatment optimization...

While it is true that many (actually it should say 'most') systems with lead lines install treatment and still have high lead, it is because we have learned that it is not possible to control lead release with treatment alone because of:

chronic lower water use homes

lead lines being disturbed every day

homes that were unoccupied for extended periods becoming reoccupied

galvanic corrosion due to partial LSL replacement and no use of dielectric connectors

etc.

These problems are made worse overall (nationally) because systems do not optimize their corrosion control treatment. AWWA acknowledged this during the NDWAC meeting, saying that 60-70 percent of systems they studied that are in compliance right now do not meet the lead action level based on lead service line samples. While that is not the compliance sampling protocol right now, it just shows you that they are not treating to minimize lead, they are treating to meet the lead action level based on first-draw (and in the case of MI systems, pre-flushed first-draw) samples and that is inadequate treatment. When something goes wrong or changes are made, a system can easily exceed the lead action level (unless they are pre-flushing and/or gaming the site selection and/or throwing out valid samples).

STRATEGIC NEXT STEPS FOR FLINT TO ADDRESS LEAD CORROSION CONCERNS

Tom Poy discussed Marc Edwards' website, "Flint, MI Water Study Updates" (https://flintwaterstudyupdates.wordpress.com/). The discussion focused on the lead sampling and analytical results Marc Edwards' team posted to their website. Tom emphasized that EPA is not involved with Marc Edwards' work in Flint. Tom mentioned that the Edwards team's samples may not have been analyzed by a certified lab (which is only required for compliance samples) nor taken from sites that qualify as Tier 1 for LCR compliance sampling, but the results give further evidence that lead levels in Flint are trending upward. (The conclusion that there is an increasing trend of lead concentrations at consumer taps builds upon earlier compliance sampling taken by Flint in 2014 and 2015 that showed the 90th percentile of the 1st 6-month sampling period at 6ppb, then the 90th percentile of the 2nd 6-month sampling period at 11ppb.)

The "Flint, MI Water Study Updates" website is putting added pressure on MDEQ and EPA to ensure that Flint addresses their lack of optimized corrosion control treatment in an expedited manner in order to protect the residents from exposure to high lead levels. Richard noted that there are numerous systems across the country that have installed corrosion control treatment, have optimized their corrosion control, but continue to have high lead levels. We all acknowledged that this is true, but we all also acknowledged that to delay installation of corrosion control treatment in Flint would likely cause even higher levels of lead over time as Flint's approximately 15,000 lead service lines are continuously in contact with corrosive water.

Region 5 and MDEQ brainstormed on strategic next steps for Flint to address lead corrosion concerns. These steps included:

1. **Public Education for Flint Residents.** Liane has contacted the Department of Community Health to discuss developing a consumer lead education piece outlining the consumer's responsibilities to lower the lead in their drinking water. The Region was glad to hear of a plan to initiate Lead Public Education. The educational material could include steps consumers can take immediately to reduce their exposure to lead in drinking water (flushing their lines after long stagnation periods, using filters certified to remove lead, etc.) as well as longer term fixes to remove lead sources (for example, financing the cost to remove any part of a lead service line on the owner's property at the same time as Flint is replacing its portion of the lead service line).

2. **Gathering Information on Flint's Future Treatment Plans.** Steve Busch said Flint and their engineering consultants were meeting this week (Sept 1) to discuss conceptually the necessary optimized corrosion control treatment at Flint. Tom Poy shared EPA lead experts' (Mike Schock and Darren Lytle of EPA's Office of Research and Development in Cincinnati) caution against simply adding orthophosphate without first studying the water quality and existing distribution system conditions to ensure that any installed treatment has a good chance of working. EPA lead experts have research and field experience showing the complexity of optimizing corrosion control treatment when water quality is significantly changed, as is the case for Flint.

3. **Offering Flint Free Help from EPA Experts.** Steve Busch has already provided the names of EPA lead experts (Mike Schock and Darren Lytle) to Flint, as has Susan Hedman, R5 Administrator. MDEQ and Region 5 agree that, to successfully control lead corrosion in the

distribution system, Flint needs to review this situation holistically, while also addressing the lead issue in an expedited manner.

4. **Laying Groundwork for MDEQ/EPA Collaboration with Flint.** If Flint accepts the offer of technical assistance for optimizing corrosion control, Tom Poy suggested that MDEQ and EPA lead experts (Mike Schock and Darren Lytle) form a partnership to provide such help. EPA experts are able to provide pipe scale analyses, as well as other laboratory support. Although Flint (using their consultant) bears the ultimate responsibility for designing and installing corrosion control, MDEQ and EPA experts are willing and able to provide advice throughout the process.

Richard,

I spoke this morning with Mike Glasgow (Utility Administrator) and Brent Wight (WTP Supt) to see what came out of their meeting with LAN and the city. The meeting's main focus was over the lawsuit and financial issues; however, corrosion control treatment was also discussed. City administration told Mike and Brent that there will be no funding restrictions to install corrosion control. The capital cost to install treatment (P04 feed system) is not expected to be high since the WTP has existing feed lines and equip in place; however, new properly sized pumps will be needed. Mike expects LAN to have a proposal for us to review and approve for issuance of an Act 399 construction permit within the next one to two months.

Subject: Flint water questions from Flint Journal reporter

Hello,

Ron Fonger, a reporter with MLive Media Group and the Flint Journal newspaper contacted Public Affairs this morning with some Flint water questions. The questions derive from an email from Heather Shoven to a resident (Citizen name / Ex. 6) and the Miguel del Toro memo. His questions appear to follow ACLU investigative reporter Curt Guyette's inquiries in August. Don't know why the Flint Journal suddenly wants answers from us. But can you Water folks answer these questions and also update our July desk statement if necessary?

Here are the questions from the Flint Journal:

•□□□□□□ How is EPA providing assistance to the city and state on the Flint water issue?

EPA has offered the services of distribution system experts from our Office of Research and Development to compliment the MDEQ experts to provide technical assistance to Flint.

•□□□□□□ What is the response from Flint and MDEQ to EPA's offers of assistance?

We have not received a response from Flint.

•□□□□□□ Is EPA officially recommending Flint switch back to Detroit water?

EPA is not officially making any recommendations about the source of Flint's drinking water. The situation needs to be analyzed by the experts.

Should our July desk statement be updated?

DESK STATEMENT

EPA continues to work closely with the Michigan Department of Environmental Quality and the City of Flint to ensure that Flint residents are provided with safe drinking water. EPA conducted limited drinking water sampling for lead in Flint in response to a citizen complaint. The initial results and staff recommendations to management were documented in an internal memorandum, which was cited in the ACLU article. EPA will work with Michigan DEQ and the City of Flint to verify and assess the extent of lead contamination issues and to ensure that Flint's drinking water meets federal standards.

Flint residents who are concerned about lead in their drinking should contact the utility and may request that their water be sampled. Additional information about lead in drinking water is available at http://water.epa.gov/drink/contaminants/basicinformation/lead.cfm.

Here are the EPA answers to questions by the ACLU investigative reporter. Are these still OK or should they be updated?

Mr. Guyette,

Below are responses to your questions and can be attributed to U.S. EPA.

Q. Mr. Del Toral asserts that a city the size of Flint is required to use a corrosion control treatment such as phosphate in their drinking water. Is Mr. Del Toral correct?

Flint and other large drinking water systems are required to evaluate and optimize pipe corrosion control treatment to protect water from contaminants such as lead. When the city started sourcing drinking water from the Flint River in April 2014, the Michigan Department of Environmental Quality determined that Flint should follow the protocol for new systems -- which requires two new rounds of water sampling to determine whether corrosion control treatment is needed. The city has submitted sampling results for the six-month periods from July-December 2014, and from January-June 2015. MDEQ is currently analyzing the sampling data to determine whether corrosion control treatment is needed.

Q. Also, both Mr. Del Toral, and Marc Edwards, an expert on the issue at Virginia Tech, both say that the manner in which Flint conducts its tests is almost certain to minimize the risk and miss worst-case scenarios. What is the EPA's opinion regarding that?

Michigan complies with the Federal Safe Drinking Water Act's protocol which requires that the tap remain unused for at least 6 hours before taking a sample. EPA is currently revising the federal lead and copper rule to address several issues including sampling protocols.

In addition, EPA notes that the water samples taken from the Citizen name / Ex. 6 residence were atypical in two ways:

- □□□□□□ the tap had not been run for over three weeks before the samples were taken. Stagnation can cause higher lead levels, and

- □□□□□□ the home's long service line is configured in an unusual way.

Thanks for your help. I promised the Flint newspaper reporter no time frame but as Anne Rowan noted, I imagine we're almost shutting down tomorrow.

- john

Tom,

The message below from Mike Prysby provides additional information about the city's plans to install optimal corrosion control. The last sentence indicates that Flint is going to invite additional EPA experts to join their TAC.

Subject: Flint Water

Technical Advisory Team,

I am pleased to report that the City of Flint has officially returned to compliance with the Michigan Safe Drinking Water Act and we have received confirming documentation from the DEQ today. The GAC filtering was installed on time and was instrumental in our ability to maintain an average level under the MCL. We anticipate that we will have no further notices going out.

Recent testing has raised questions regarding the amount of lead that is being found in the water and I wanted to report to you our current status.

At the onset of our plant design, optimization for lead was addressed and discussed with the engineering firm and with the DEQ. It was determined that having more data was advisable prior to the commitment of a specific optimization method. Most chemicals used in this process are phosphate based and phosphate can be a "food" for bacteria. We have performed over one hundred and sixty lead tests throughout the city since switching over to the Flint River and remain within the EPA standards.

We are currently designing an optimization plan with the engineering firm that will be presented to the DEQ and upon approval we expect to have it implemented by January 2016. It is worthwhile to note that the DEQ has reported that other cities have taken years to complete an optimization plan and we anticipate having a plan in place over the next four months.

It is also worth noting to this group that there are different lead testing methods used within industry and the city remains consistent with the most recent EPA approved testing method which can produce different results than other methods.

We hope to schedule another TAC team meeting for late September or early October, I will attempt to keep everyone informed and look for the best dates. We are inviting additional EPA experts to become a part of this committee.

Thank you,

--

3. Status of Flint

a. TTHM levels for May—Due to MDEQ district engineer June 10-RECEIVED; see link to results

https://www.cityofflint.com/2015/06/01/may-water-testing-results-show-all-locations-are-within-acceptable-limits-for-tthm/

All samples below the TTHM MCL; one site still has an LRAA above the MCL but decreased from 105 ppb in Feb to 93.5 ppb in May.

Mike Prysby said he is getting ready to issue the construction permit to the City of Flint to install a GAC filter in July, that will remove more TOC to further reduce the potential of developing TTHMs. Mike said he has already issued a construction permit for a transmission line within the City that will help reduce water age.

b. Lead in Flint

Our discussions with MDEQ indicate that no phosphates/corrosion control has been added to the system since April 2014 when the source of drinking water changed to the Flint River. We understand that the City is just finishing up its second set of 6-month initial monitoring for lead; where the results will probably warrant a Corrosion Control Study to be conducted. Since Flint has lead service lines, we understand some citizen-requested lead sampling is exceeding the Action Level, and the source of drinking water will be changing again in 2016, so to start a Corrosion Control Study now doesn't make sense. The idea to ask Flint to simply add phosphate may be premature; there are many other issues and factors that must be taken into account which would require a comprehensive look at the water quality and the system before any treatment recommendations can/should be made. Miguel is recommending MDEQ and EPA? approach Flint about formally requesting EPA's Office of Research and Development in Cincinnati support on the lead in Flint drinking water issue, and request that Mike Schock, ORD, and possibly Darren Lytle, ORD, to participate in Flint's drinking water advisory committee so that a comprehensive evaluation on how to proceed can be discussed.

Miguel provided a brief summary of the high lead results found at the residence of Citizen name / Ex. 6 Citizen name / Ex. 6 in Flint. Miguel will follow up with a written summary of the work conducted, sample results, and conclusions.

Miguel believes that lead levels in Flint are being affected by the lack of Corrosion Control being conducted by the City, since the LCR requires 2 6-month initial monitoring for a new source. Steve Busch stated that in the Lead sampling pool, almost all of the lead sample sites are lead service lines, and the State is not seeing large increases in lead levels at the tap. Miguel suggested that EPA experts in Lead, Mike Schock; and in distribution systems, Darren Lytle, be added to the Flint drinking water advisory committee to assist the City/State in determining the best way to proceed to minimize lead in the City's drinking water during the interim use of the Flint River, and subsequent use of Lake Huron water.

Miguel said he will send Mike Schock and Darren Lytle's contact information to Steve and Mike. Steve pointed out that the City is following the LCR requirements, and completing the requirements in a timely manner. Miguel's point is that since the LCR was promulgated 20+ years ago, that research and different situations, like Washington D.C., have educated scientists, experts, and regulators that the existing requirements in the LCR may not be as protective as previously thought. Thus, he can only make recommendations as to how to revise sampling protocols. And Miguel acknowledges that it may be another year before these regulation changes are promulgated in the Long-Term Lead and Copper Rule. In December 2015, the NDWAC recommendation is expected.

The Region asked the State if the Flint River will be a permanent supplemental source of drinking water, once the City of Flint connects with the Karegdodi pipeline from Lake Huron. Mike Prysby said that the City is currently pumping 22MGD, but the City has 40-50 MG of storage. The City is currently working on reducing its unaccounted for water losses, and these water losses are dropping. The State, through the Governor's office, provided disadvantaged system funding, $2M which includes $900K for lead detection, and pipe inspection.

Tom,

Mike and I got a call from Howard Croft (Director Public Works I think) today. I spoke with him and he informally invited us to help. Mike and I are very aware of the tensions here and the high profile nature of the situation so we want to make sure our involvement is known and supported up our chain of command, and think it will be important to have a formal request to assist. I really hope we can help because it is definitely needed.

Thanks,

Darren

Subject: Flint Water

Technical Advisory Team,

I am pleased to report that the City of Flint has officially returned to compliance with the Michigan Safe Drinking Water Act and we have received confirming documentation from the DEQ today. The GAC filtering was installed on time and was instrumental in our ability to maintain an average level under the MCL. We anticipate that we will have no further notices going out.

Recent testing has raised questions regarding the amount of lead that is being found in the water and I wanted to report to you our current status.

At the onset of our plant design, optimization for lead was addressed and discussed with the engineering firm and with the DEQ. It was determined that having more data was advisable prior to the commitment of a specific optimization method. Most chemicals used in this process are phosphate based and phosphate can be a "food" for bacteria. We have performed over one hundred and sixty lead tests throughout the city since switching over to the Flint River and remain within the EPA standards.

We are currently designing an optimization plan with the engineering firm that will be presented to the DEQ and upon approval we expect to have it implemented by January 2016. It is worthwhile to note that the DEQ has reported that other cities have taken years to complete an optimization plan and we anticipate having a plan in place over the next four months.

It is also worth noting to this group that there are different lead testing methods used within industry and the city remains consistent with the most recent EPA approved testing method which can produce different results than other methods.

We hope to schedule another TAC team meeting for late September or early October, I will attempt to keep everyone informed and look for the best dates. We are inviting additional EPA experts to become a part of this committee.

Thank you,

--

Subject: Re: FYI / Flint Journal : Lead leaches into 'very corrosive' Flint, Michigan, drinking water, researchers say

The sampling project is ongoing. A summary of the results from samples analyzed so far are on the following website:

http://flintwaterstudy.org/information-for-flint-residents/results-for-citizen-testing-for-lead-300-kits/

These sample results are from residents' homes. Basically anyone that wants to sample their drinking water, so they include homes that are high risk and homes that are not. The city of flint estimates that they have about 15,000 lead service lines. Based on information from one of the companies in flint that replaces service lines, the lead portion of the service line is usually only on the utility side, from the water main to the property line, but they have seen some lead service lines that go from the water main all the way into the home as well.

(I couldn't find where Virginia Tech reported the lead levels from Flint DW, so if anyone does find it, please share…thanks!)

Lead leaches into 'very corrosive' Flint, Michigan, drinking water, researchers say.

Flint drinking water is "very corrosive" and "causing lead contamination in homes," researchers from Virginia Tech University reported online Wednesday, Sept. 2.

Flint Journal, Michigan.

Tom,

Mike and I got a call from Howard Croft (Director Public Works I think) today. I spoke with him and he informally invited us to help. Mike and I are very aware of the tensions here and the high profile nature of the situation so we want to make sure our involvement is known and supported up our chain of command, and think it will be important to have a formal request to assist. I really hope we can help because it is definitely needed.

Thanks,

Darren

Subject: Flint Water

Technical Advisory Team,

I am pleased to report that the City of Flint has officially returned to compliance with the Michigan Safe Drinking Water Act and we have received confirming documentation from the DEQ today. The GAC filtering was installed on time and was instrumental in our ability to maintain an average level under the MCL. We anticipate that we will have no further notices going out.

Recent testing has raised questions regarding the amount of lead that is being found in the water and I wanted to report to you our current status.

At the onset of our plant design, optimization for lead was addressed and discussed with the engineering firm and with the DEQ. It was determined that having more data was advisable prior to the commitment of a specific optimization method. Most chemicals used in this process are phosphate based and phosphate can be a "food" for bacteria. We have performed over one hundred and sixty lead tests throughout the city since switching over to the Flint River and remain within the EPA standards.

We are currently designing an optimization plan with the engineering firm that will be presented to the DEQ and upon approval we expect to have it implemented by January 2016. It is worthwhile to note that the DEQ has reported that other cities have taken years to complete an optimization plan and we anticipate having a plan in place over the next four months.

It is also worth noting to this group that there are different lead testing methods used within industry and the city remains consistent with the most recent EPA approved testing method which can produce different results than other methods.

We hope to schedule another TAC team meeting for late September or early October, I will attempt to keep everyone informed and look for the best dates. We are inviting additional EPA experts to become a part of this committee.

Thank you,

--

Howard Croft

Flint Mayor Dayne Walling is shown at the Flint water treatment plant in this Flint Journal file photo.Flint Journal file photo

FLINT, MI -- The city says it will put measures in place to reduce lead in drinking water by 2016, an announcement that comes one day after a water expert warned of the potential for a "huge public health problem" here.

Mayor Dayne Walling said in a statement issued by the city Thursday, Sept. 3, that Flint "will work with the (Michigan Department of Environmental Quality) on implementing water optimization measures to reduce the corrosive effects of water on older pipes and home service lines."

The statement says the city wants to fast-track measures aimed at reducing lead, which can leach into water that comes in contact with lead pipes or lead solder. The city did not detail actions that might be taken.

Students and faculty at Virginia Polytechnic Institute and State University distributed 300 water test kits to Flint residents this summer. They reported this week that 42 percent of 120 initial samples had lead levels more than 5 parts per billion, "which suggests a serious lead-in-water problem, according to our experience and criteria."

Twenty percent of the initial samples also exceeded the U.S. Environmental Protection Agency lead action limit of 15 ppb, the report said.

Marc Edwards, a professor of civil and environmental engineering, said experiments on Flint's tap water also show it is much more corrosive than water supplied by the city of Detroit. Flint purchased water from Detroit for more than 50 years — until April 2014.

Flint water contains about eight times more chloride than Detroit water does, he said, and chloride is generally considered very corrosive to iron.

Thursday's news release from the city does not specify what actions Flint officials might take to better control corrosion, but Richard Benzie, chief of field operations in the DEQ Office of Drinking Water and Municipal Assistance, said the process will include checking for factors that contribute to corrosiveness, such as alkalinity.

Solutions can involve the addition of supplements such as phosphates, said Benzie. He said the DEQ suggested Flint officials speed up the process of developing a plan for corrosion control last month as concerns about lead in Flint water were increasingly being raised.

Melissa Mays, a founder of Water You Fighting For, said Flint officials have been slow to consider the fallout from Flint River water on lead or lead solder pipes, which are in an estimated 15,000 homes in the city.

"This (planning) should have been done immediately," said Mays, whose group is assisting in the Virginia Tech water testing. "I think this (testing) is forcing them to react in some way."

Virginia Tech reported online about its experiments on Flint water, saying it "leaches more lead from plumbing than does Detroit water ... creating a public health threat in some Flint homes that have lead pipe or lead solder."

Mays said initial test results show lead readings in excess of 15 ppb in each ZIP code in Flint.

Benzie said the Flint water system is not in violation of state or federal drinking water standards for lead but would eventually have been required to undertake a water optimization study due to the size of the water system and the presence of lead.

State officials have stressed that lead in the city water is not coming from the city's treatment plant or transmission lines, but from lead plumbing and service lines in homes.

Lead is a toxic metal that was used for many years in products found in and around homes, according to EPA.

"Even at low levels, lead may cause a range of health effects, including behavioral problems and learning disabilities," EPA's website says. "Children 6 years old and under are most at risk because this is when the brain is developing."

Subject: Re: Lead Testing - Media Question

Good morning all...

There appears to be some confusion as to who collected the samples. There were multiple sampling events at the Citizen name / Ex. 6 home. The following is a summary of sampling conducted at the Citizen name / Ex. 6 home that I am aware of.

Sampling history at the Citizen name / Ex. 6 home

At the residents' request, the City of Flint tested the drinking water at the home of Citizen name / Ex. 6 for lead on two occasions. The lead results were 104 µg/L on February 18, 2015, and 397 µg/L on March 3, 2015.

Subsequent to the discovery of these high lead levels, the City of Flint shut off the water to the Citizen name / Ex. 6 home on April 3, 2015.

The water was briefly turned back on by the Citizen name / Ex. 6 on April 27-28, 2015 to collect additional samples. The water had sat unused from April 3, 2015 to April 27, 2015.The kitchen tap was flushed for 45 minutes the night of April 27, 2015 and a series of sequential samples (total of 30) were collected on April 28, 2015 by Citizen name / Ex. 6 These samples were sent to Dr. Marc Edwards at Virginia Tech for analysis. The sample results ranged in value from 200 µg/L to 13,200 µg/L, with an average value of 2,500 µg/L.

It was found that a portion of the service line serving the Citizen name / Ex. 6 home was made of lead and the City of Flint replaced the Walters' service line on May 6, 2015.

Following the replacement of the service line, a total of 18 samples were collected by Citizen name / Ex. 6 on May 13, 2015 and sent to the U.S. EPA Chicago Regional Laboratory for analysis. The results of 15 sequential samples (one sample collected right after another) from the kitchen tap ranged from 0.51 µg/L to 3.9 µg/L, with an average of 1.5 µg/L, indicating that the replacement of the service line was successful in removing the source of lead into the Citizen name / Ex. 6 home. The bathroom tap result was 5.5 µg/L and the two sample results from the hot water heater were 31.7 µg/L and 9.74 µg/L.

Note: The water heater was sampled as it is typical to find lead-bearing deposits accumulated in the water heaters where upstream sources of lead are or were present, which is one of the reasons why EPA/CDC advises people not to use hot water for cooking or making formula.

Subject: RE: Lead Testing - Media Question

Josh- I'm not sure who is in today who'd be to respond or if EPA would share discuss testing results for a private home with a reporter. We do have a statement from yesterday that we can share with this reporter today. The rest may have to wait until Tuesday. If so, Peter will pick it up.

Tom, Tinka, if you're working today – any advice about how to proceed? Thanks.

Below is a statement the RA approved yesterday:

EPA and the Michigan Department of Environmental Quality are working closely with the City of Flint to ensure that residents are provided with safe drinking water. MDEQ determined that although recent lead monitoring shows Flint has not exceeded the lead action level (15 ug/L), the results indicate Flint does not have optimized corrosion control. EPA and MDEQ have recommended that Flint implement corrosion control treatment as soon as possible since the city's lead service lines can leach lead into the drinking water if left untreated.

The City of Flint recently accepted EPA's offer to provide technical assistance to the City and MDEQ on the optimization of corrosion control in the city's water distribution system. The City's Technical Advisory Committee has been notified that experts from EPA's Office of Research and Development (in Cincinnati) will join the panel.

Flint residents who are concerned about lead in their drinking should contact the water utility and may request their water be sampled. Additional information about lead in drinking water is available at http://water.epa.gov/drink/contaminants/basicinformation/lead.cfm.

The City of Flint recently accepted EPA's offer to provide technical assistance to the City and MDEQ on the optimization of corrosion control in the city's water distribution system. The City's Technical Advisory Committee has been notified that experts from EPA's Office of Research and Development (in Cincinnati) will join the panel.

Flint residents who are concerned about lead in their drinking should contact the water utility and may request their water be sampled. Additional information about lead in drinking water is available at http://water.epa.gov/drink/contaminants/basicinformation/lead.cfm.

Subject: FW: Lead Testing - Media Question

Please see the reporter's question below.

I am not sure if we can tell media what private residences we have tested (if we have tested this residence).

Do we have any personnel in Flint who would be appropriate for the reporter to interview?

Is there a desk statement that we used to respond to the inquiry from the Flint Journal that we received yesterday that we can send to this reporter?

For now, I will tell the reporter that I will check on her question but may not be able to respond this afternoon.

Thanks.

Subject: RE: Lead Testing - Media Question

This is regarding some testing that was done at Citizen name / Ex. 6 home in the City of Flint.
She lives at Personal Address / Ex. 6 She presented documentation from Miquel Del Toral that the water was tested.
The results of multiple testing showed extremely high levels of Lead in the water.
I would like to confirm that the testing was done and the preliminary report is in fact real.

Also, if there is any way someone could do an interview with us next week about this I would like to at least put that out there.

Josh- I'm not sure who is in today who'd be to respond or if EPA would share discuss testing results for a private home with a reporter. We do have a statement from yesterday that we can share with this reporter today. The rest may have to wait until Tuesday. If so, Peter will pick it up.

Tom, Tinka, if you're working today – any advice about how to proceed? Thanks.

Below is a statement the RA approved yesterday:

EPA and the Michigan Department of Environmental Quality are working closely with the City of Flint to ensure that residents are provided with safe drinking water. MDEQ determined that although recent lead monitoring shows Flint has not exceeded the lead action level (15 ug/L), the results indicate Flint does not have optimized corrosion control. EPA and MDEQ have recommended that Flint implement corrosion control treatment as soon as possible since the city's lead service lines can leach lead into the drinking water if left untreated.

The City of Flint recently accepted EPA's offer to provide technical assistance to the City and MDEQ on the optimization of corrosion control in the city's water distribution system. The City's Technical Advisory Committee has been notified that experts from EPA's Office of Research and Development (in Cincinnati) will join the panel.

Flint residents who are concerned about lead in their drinking should contact the water utility and may request their water be sampled. Additional information about lead in drinking water is available at http://water.epa.gov/drink/contaminants/basicinformation/lead.cfm.

Hello! This is Jessica Dupnack from ABC 12 News in Flint, MI.
I have been working on a story about the Lead levels in the City's water supply.
A woman named [redacted] Citizen name / Ex. 6 provided me with some paperwork indicating that the EPA did some testing at her home.
She told me that it was a preliminary report and that there would be more to come from your end.
I have seen the report surface in other news articles by a simple Google search.

I would like to talk further with you about the authenticity of the report.
Please give me a call when you can at 248-721-1301.

Thank you.

Pete: Miguel's comments about "pre-flushing" are his professional views on the matter. EPA does not officially have a position on pre-flushing as the practice is not specifically prohibited by the Lead and Copper Rule. A number of States allow pre-flushing.

EPA offered the technical assistance of national experts from our Office of Research Development in July 2015.

>> •□□□□□□□□ The City of Flint recently accepted EPA's offer to provide technical assistance to the City and MDEQ on the optimization of corrosion control in the city's water distribution system. The City's Technical Advisory Committee has been notified that experts from EPA's Office of Research and Development (in

Cincinnati) will join the panel.

Updated Desk Statement

EPA and the Michigan Department of Environmental Quality are working closely with the City of Flint to ensure that residents are provided with safe drinking water. MDEQ determined that although recent lead monitoring shows Flint has not exceeded the lead action level (15 ug/L), the results indicate Flint does not have optimized corrosion control. EPA and MDEQ have recommended that Flint implement corrosion control treatment as soon as possible since the city's lead service lines can leach lead into the drinking water if left untreated.

Flint residents who are concerned about lead in their drinking should contact the water utility and may request their water be sampled. Additional information about lead in drinking water is available at http://water.epa.gov/drink/contaminants/basicinformation/lead.cfm.

We could update our statement to say the following:

REVISEDED Updated Desk Statement

I think we should comment on the third document first -- saying that EPA advises everyone across the country to flush their pipes before drawing water for drinking -- and we should provide the reporter with the links to tips our website. Let"s emphasize this point -- it's the most important thing we can do to protect public health.

I don't think we should comment on the letter from the mayoral candidate.

I think our comment on the memo should be the updated desk statement that Tinka circulated earlier today:

EPA and the Michigan Department of Environmental Quality are working closely with the City of Flint to ensure that residents are provided with safe drinking water. MDEQ determined that although recent lead monitoring shows Flint has not exceeded the lead action level (15 ug/L), the results indicate Flint does not have optimized corrosion control. Hi Lisa,

The answer to #1 would be yes. Although I don't know how many systems overall (nationally or even in R5) are making such changes, we have approximately 20 or so more systems in MI that will be affected in the next year or so. Along with Flint, there are something like 20 other towns that will be switching from their current source water to the new KWA pipeline which is under construction and scheduled for completion at the end of 2016. We have been having discussions with MDEQ to ensure that these systems maintain OCCT when the transition sources.

Mike may know of others, so I am copying him on this.

If you have any further questions, please let me know.

Subject: A few questions for you

Hi Peter:

It was great to see you at the OWL Summit a few weeks ago. Thanks for your great introduction of Bill Reilly!

If you have a minute, I would love your views on an issue facing the city of Flint right now. Undoubtedly you have heard that Marc Edwards responds to requests from citizen advocacy groups to test consumer water samples for lead. I don't think Flint is the only city where his testing is occurring, but because of the corrosiveness of Flint's water (which I understand is still within SDWA compliance requirements) the samples from consumer premise plumbing and service lines are turning up beyond the acceptable lead levels. Flint, as an older city, obviously still has service lines and premise plumbing with lead soldering, and Marc's students test results are now causing understandable alarm among Flint's residents. Advocacy groups are clamoring for changes to Flint's water corrosivity to reduce the risk of leaching lead.

So here are two questions for you.

1. I imagine that this situation is not unique to Flint alone. Are there other US cities that have come to your attention facing this same problem? Who might those be? And how are they dealing with this issue?

2. Is there an EPA protocol or requirement that utilities should routinely test for lead levels emanating from customer premise plumbing? And then an established protocol for addressing high lead levels when found?

Thanks for your help! I feel a little embarrassed going right to the top with these questions, but I hope you don't mind. If there is someone in your shop that I should send contact, please let me know.

Here's the link to the KWA website. They will be providing raw (untreated) Lake Huron water to these towns once the pipeline is completed. Some of them also currently receive Detroit water, so they would be switching from purchasing treated Detroit water to receiving untreated Lake Huron water.

From: Kelley, Jeff
Sent: Thur 9/10/2015 4:04:15 PM
Subject: RE: Flint

Here's what we drafted to share with the reporter … the first paragraph is lifted from OW's website:

EPA advises everyone across the country to flush their pipes before drinking water to reduce any exposure to lead. The more time water has been sitting in your home's pipes, the more lead it may contain. Anytime the water in a particular faucet has not been used for six hours or longer, "flush" the cold-water pipes by running the water. Flushing times can vary based on the plumbing configuration in the home and whether the home has a lead service line.

EPA and the Michigan Department of Environmental Quality are working closely with the city of Flint to ensure that residents are provided with safe drinking water. MDEQ determined that although recent lead monitoring shows Flint has not exceeded the lead action level (15 ug/L), the results indicate Flint does not have optimized corrosion control. In response to EPA's and MDEQ's recommendation, Flint has decided to implement corrosion control treatment as soon as possible, and has contacted experts in the EPA Office of Research and Development for assistance.

Flint residents that are concerned about lead in their drinking should contact the water utility and may request their water be sampled. Additional information about lead in drinking water is available at: http://water.epa.gov/drink/contaminants/basicinformation/lead.cfm.

This was sent to MLive on Friday:

EPA and the Michigan Department of Environmental Quality are working closely with the City of Flint to ensure that residents are provided with safe drinking water. MDEQ determined that although recent lead monitoring shows Flint has not exceeded the lead action level (15 ug/L), the results indicate Flint does not have optimized corrosion control. EPA and MDEQ have recommended that Flint implement corrosion control treatment as soon as possible since the city's lead service lines can leach lead into the drinking water if left untreated.

The City of Flint recently accepted EPA's offer to provide technical assistance to the City and MDEQ on the optimization of corrosion control in the city's water distribution system. The City's Technical Advisory Committee has been notified that experts from EPA's Office of Research and Development (in Cincinnati) will join the panel.

Flint residents who are concerned about lead in their drinking should contact the water utility and may request their water be sampled. Additional information about lead in drinking water is available at
http://water.epa.gov/drink/contaminants/basicinformation/lead.cfm.

Subject: RE: Flint

Here's what we drafted to share with the reporter … the first paragraph is lifted from OW's website:

EPA advises everyone across the country to flush their pipes before drawing drinking water to reduce exposure to lead. The more time water has been sitting in your home's pipes, the more lead it may contain. Anytime the water in a particular faucet has not been used for six hours or longer, "flush" the cold-water pipes by running the water before drinking. Flushing times can vary based on the plumbing configuration in the home and whether the home has a lead service line.

EPA and the Michigan Department of Environmental Quality are working closely with the city of Flint to ensure that residents are provided with safe drinking water. MDEQ determined that although recent lead monitoring shows Flint has not exceeded the lead action level (15 ug/L), the results indicate Flint does not have optimized corrosion control. In response to EPA and MDEQ recommendations, Flint has decided to implement corrosion control treatment and will receive EPA technical assistance to help with that effort.

Flint residents that are concerned about lead in their drinking water should contact the water utility and may request sampling. Additional information about lead in drinking water is available at:

Thanks Miguel.

Just fyi that I contacted Peter and we decided that I would give Mary Anne a call.

Quick question on the pipeline- I heard it was approximately 10 systems that were connecting….is it more like 20?

Thanks everyone.

Hope you are having a great Thursday afternoon.

Subject: RE: A few questions for you

Hi Lisa,

The answer to #1 would be yes. Although I don't know how many systems overall (nationally or even in R5) are making such changes, we have approximately 20 or so more systems in MI that will be affected in the next year or so. Along with Flint, there are something like 20 other towns that will be switching from their current source water to the new KWA pipeline which is under construction and scheduled for completion at the end of 2016. We have been having discussions with MDEQ to ensure that these systems maintain OCCT when the transition sources.

Mike may know of others, so I am copying him on this.

If you have any further questions, please let me know.

Subject: A few questions for you

Hi Peter:

It was great to see you at the OWL Summit a few weeks ago. Thanks for your great introduction of Bill Reilly!

If you have a minute, I would love your views on an issue facing the city of Flint right now. Undoubtedly you have heard that Marc Edwards responds to requests from citizen advocacy groups to test consumer water samples for lead. I don't think Flint is the only city where his testing is occurring, but because of the corrosiveness of Flint's water (which I understand is still within SDWA compliance requirements) the samples from consumer premise plumbing and service lines are turning up beyond the acceptable lead levels. Flint, as an older city, obviously still has service lines and premise plumbing with lead soldering, and Marc's students test results are now causing understandable alarm among Flint's residents. Advocacy groups are clamoring for changes to Flint's water corrosivity to reduce the risk of leaching lead.

So here are two questions for you.

1. I imagine that this situation is not unique to Flint alone. Are there other US cities that have come to your attention facing this same problem? Who might those be? And how are they dealing with this issue?

2. Is there an EPA protocol or requirement that utilities should routinely test for lead levels emanating from customer premise plumbing? And then an established protocol for addressing high lead levels when found?

Thanks for your help! I feel a little embarrassed going right to the top with these questions, but I hope you don't mind. If there is someone in your shop that I should send contact, please let me know.

Mary Ann

This was sent to MLive on Friday:

EPA and the Michigan Department of Environmental Quality are working closely with the City of Flint to ensure that residents are provided with safe drinking water. MDEQ determined that although recent lead monitoring shows Flint has not exceeded the lead action level (15 ug/L), the results indicate Flint does not have optimized corrosion control. EPA and MDEQ have recommended that Flint implement corrosion control treatment as soon as possible since the city's lead service lines can leach lead into the drinking water if left untreated.

The City of Flint recently accepted EPA's offer to provide technical assistance to the City and MDEQ on the optimization of corrosion control in the city's water distribution system. The City's Technical Advisory Committee has been notified that experts from EPA's Office of Research and Development (in Cincinnati) will join the panel.

Flint residents who are concerned about lead in their drinking should contact the water utility and may request their water be sampled. Additional information about lead in drinking water is available at http://water.epa.gov/drink/contaminants/basicinformation/lead.cfm.

Subject: RE: FY 2016 Disinvestment?

I was hoping to get a decent draft of the disinvestments together next week to have you look at, but here is my thought for CWS re the LCR reporting form (this is not the wording, just the concept):

CWS is likely willing to commit to enforcing submission of the form for samples collected during FY16 and beyond. That means we don't commit to enforcing form submittal for samples collected this summer (FY15), even though the form itself is technically due in FY16. We weren't prepared to enforce it for FY15 sampling. In FY16 we will have a person focusing on LCR sampling, so we will be in a much better position to plan for enforcement going forward.

In the notes from our semi-annual call, there was an Action item for you----I put it here, and it's in red in the context of the notes. Have you had a chance to follow up with your staff? I'll be back in the office next Tuesday and I'll follow up with you then. Have a fun holiday weekend!

Jennifer

Excerpt from semi-annual call notes:

"Kris Philip said that the CWS program is requiring that the systems submit the form, but they are not enforcing whether or not the system submits the form. Often, the CWS will submit the Lead Consumer Notice and the Lead and Copper reporting form together. Kris said if 90%+ are already submitting the forms, then the State will agree to follow-up and enforce this requirement. But, if less than that, will probably be too much of a burden. Kris said they may change the way DEQ is tracking in SDWIS during FY 2016. But, the Region said SDWIS-Prime probably won't be available until 2017 at the earliest.

ACTION: Kris Philip will research with the District Offices to determine the current submittal rate of the lead and copper reporting form from CWSs; and report back to the Region."

All—Below are my draft notes from our call last week, June 10, 2015. Thank you all for participating. I apologize for the delay in getting these out in draft to you all for review—I was hoping to get a couple of items ironed out that were fuzzy during our discussions, but hasn't happened yet. Several ACTION items below. So, please review to make sure I documented our discussion/agreements correctly, and feel free to edit as needed. I you could get back to me by July 13, that would be great. Thank you!

Jennifer

Attendees:

MDEQ: Liane Shekter-Smith, Richard Benzie, Carrie Monosmith, Kris Philip, Dan Dettweiler, Marjorie Rodriguez (Student), Kevin Holdwick, Mike Prysby, Dana DeBruyn, Steve Busch

EPA Region 5: Tom Poy, Rita Bair, Nick Damato, Janet Kuefler, Michele Palmer, Tom Murphy, Heather Shoven, Cary McElhinney, Andrea Porter, Miguel Deltoral, Mostafa Noureldin

Summary:

1.Changes in Lead Disinvestments and Commitments for FY 2016 ARDP—for discussion: Due to our extreme focus on lead in drinking water, this is the consensus here.

a. Consumer notification of tap results at NTNCWSs:

(Suggested wording) The NCWS program commits to full implementation of the lead consumer notification of tap results requirement, to begin in CY 2016. Region 5 will assist in a notification outreach effort in late FY 2015 to remaining 698 NTNCWSs that are not schools/daycares, to begin providing lead consumer notice in CY 2016. NCWS program commits to include information on providing lead consumer notice in the annual monitoring letter sent to all NTNCWSs for CY 2016.

STATE: The State found this change in the wording acceptable.

Enforcement/Investigatory / Ex. 7A

STATE: The State found this change in the wording acceptable.

c. Follow-up Actions for NTNCWSs that sample outside of June-September 2015 timeframe

Enforcement/Investigatory / Ex. 7A

Enforcement/Investigatory / Ex. 7A

d. Submittal of the lead and copper reporting form

Enforcement/Investigatory / Ex. 7A

Enforcement/Investigatory / Ex. 7A

Enforcement/Investigatory / Ex. 7A

Enforcement/Investigatory / Ex. 7A

ACTION: The Region will discuss Dan's response internally, and get back to the State with any issues/concerns.

Enforcement/Investigatory / Ex. 7A

ACTION: Kris Philip will research with the District Offices to determine the current submittal rate of the lead and copper reporting form from CWSs; and report back to the Region.

2. Enforcement Update with Heather

Enforcement/Investigatory / Ex. 7A

Enforcement/Investigatory / Ex. 7A

3. Status of Flint

a. TTHM levels for May—Due to MDEQ district engineer June 10-RECEIVED; see link to results

https://www.cityofflint.com/2015/06/01/may-water-testing-results-show-all-locations-are-within-acceptable-limits-for-tthm/

All samples below the TTHM MCL; one site still has an LRAA above the MCL but decreased from 105 ppb in Feb to 93.5 ppb in May.

Mike Prysby said he is getting ready to issue the construction permit to the City of Flint to install a GAC filter in July, that will remove more TOC to further reduce the potential of developing TTHMs. Mike said he has already issued a construction permit for a transmission line within the City that will help reduce water age.

b. Lead in Flint

Our discussions with MDEQ indicate that no phosphates/corrosion control has been added to the system since April 2014 when the source of drinking water changed to the Flint River. We understand that the City is just finishing up its second set of 6-month initial monitoring for lead; where the results will probably warrant a Corrosion Control Study to be conducted. Since Flint has lead service lines, we understand some citizen-requested lead sampling is exceeding the Action Level, and the source of drinking water will be changing again in 2016, so to start a Corrosion Control Study now doesn't make sense. The idea to ask Flint to simply add phosphate may be premature; there are many other issues and factors that must be taken into account which would require a comprehensive look at the water quality and the system before any treatment recommendations can/should be made. Miguel is recommending MDEQ and EPA? approach Flint about formally requesting EPA's Office of Research and Development in Cincinnati support on the lead in Flint drinking water issue, and request that Mike Schock, ORD, and possibly Darren Lytle, ORD, to participate in Flint's drinking water advisory committee so that a comprehensive evaluation on how to proceed can be discussed.

Miguel provided a brief summary of the high lead results found at the residence of Citizen name / Ex. 6 Citizen name / Ex. 6 in Flint. Miguel will follow up with a written summary of the work conducted, sample results, and conclusions.

Miguel believes that lead levels in Flint are being affected by the lack of Corrosion Control being conducted by the City, since the LCR requires 2 6-month initial monitoring for a new source. Steve Busch stated that in the Lead sampling pool, almost all of the lead sample sites are lead service lines, and the State is not seeing large increases in lead levels at the tap. Miguel suggested that EPA experts in Lead, Mike Schock; and in distribution systems, Darren Lytle, be added to the Flint drinking water advisory committee to assist the City/State in determining the best way to proceed to minimize lead in the City's drinking water during the interim use of the Flint River, and subsequent use of Lake Huron water.

Miguel said he will send Mike Schock and Darren Lytle's contact information to Steve and Mike. Steve pointed out that the City is following the LCR requirements, and completing the requirements in a timely manner. Miguel's point is that since the LCR was promulgated 20+ years ago, that research and different situations, like Washington D.C., have educated scientists, experts, and regulators that the existing requirements in the LCR may not be as protective as previously thought. Thus, he can only make recommendations as to how to revise sampling protocols. And Miguel acknowledges that it may be another year before these regulation changes are promulgated in the Long-Term Lead and Copper Rule. In December 2015, the NDWAC recommendation is expected.

The Region asked the State if the Flint River will be a permanent supplemental source of drinking water, once the City of Flint connects with the Karegdodi pipeline from Lake Huron. Mike Prysby said that the City is currently pumping 22MGD, but the City has 40-50 MG of storage. The City is currently working on reducing its unaccounted for water losses, and these water losses are dropping. The State, through the Governor's office, provided disadvantaged system funding, $2M which includes $900K for lead detection, and pipe inspection.

4. Update on WaterTrack to SDWIS-State: The migration of WaterTrack data to SDWIS-State was number 39 on the Dept of Technology Management and Budget's (DTMB) project list last year; this year it is

number 30. It doesn't appear this project has a high priority. Does the State have any new information on the progress of this project?

Nonresponsive

5. Consequences of cutting the State drinking water program to a "minimal program"

Jennifer had a discussion with Richard Benzie regarding the possibility of the Michigan State Legislature looking to have just a minimal drinking water program, meaning only a program with activities that are required by the Federal SDWA. Jennifer ultimately discussed this internally with Tom Poy. The minimal program suggested would cut out Operator Certification, Capacity Development, Plan Review, Cross Connection Control, Source Water Protection, among other programs that are State required. Operator Certification and Capacity Development, while not required by the Federal regulations, do have financial strings attached. And Plan review/construction permits are required by the SRF program for a loan. Any recent communication with the State Legislature that they might proceed and make this possibility a reality?

Richard and Liane said there is no current threat from the State Legislature to cut the State-funded PWSS program activities. But there is a State-wide impetus to delete old programs and regulations, so this could lead to questioning the purpose of State-funded PWSS program activities. Richard is just being proactive in preparing a justification. Richard remembers a discussion many years ago about what constitutes a "comprehensive drinking water program". Tom Poy and Jennifer commented in a previous communication with Richard that the EPA PWSS primacy program and the State-funded activities in the drinking water program were meant to complement each other. To support this statement, Jennifer sent Richard some PWSS Priority guidance from the 90's, some preamble language from the 1976 SDWA found by our attorney, and language from Section 142 of the SDWA regulations from 1976 that might assist him in his justification.

Subject: Slightly revised responses to 2 follow-up questions re: Flint drinking water

Q. Mr. Del Toral asserts that a city the size of Flint is required to use a corrosion control treatment such as phosphate in their drinking water. Is Mr. Del Toral correct?

Flint and other large drinking water systems are required to evaluate and optimize pipe corrosion control treatment to protect water from contaminants such as lead. When the City started sourcing drinking water from the Flint River in April 2014, the Michigan Department of Environmental Quality determined that Flint should follow the protocol for new systems -- which requires two new rounds of water sampling to determine whether corrosion control treatment is needed. The City has submitted sampling results for the six-month periods from July-December 2014, and from January-June 2015. MDEQ is currently analyzing the sampling data to determine whether corrosion control treatment is needed.

Q. Also, both Mr. Del Toral, and Marc Edwards, an expert on the issue at Virginia Tech, both say that the manner in which Flint conducts its tests is almost certain to minimize the risk and miss worst-case scenarios. What is the EPA's opinion regarding that?

Michigan complies with the Federal Safe Drinking Water Act's protocol which requires that the tap remain unused for at least 6 hours before taking a sample. EPA is currently revising the federal lead and copper rule to address several issues including sampling protocols.

In addition, EPA notes that the water samples taken from the Citizen name / Ex. 6 residence were atypical in two ways:

- the tap had not been run for over three weeks before the samples were taken. Stagnation can cause higher lead levels, and

- the home's long service line is configured in an unusual way.

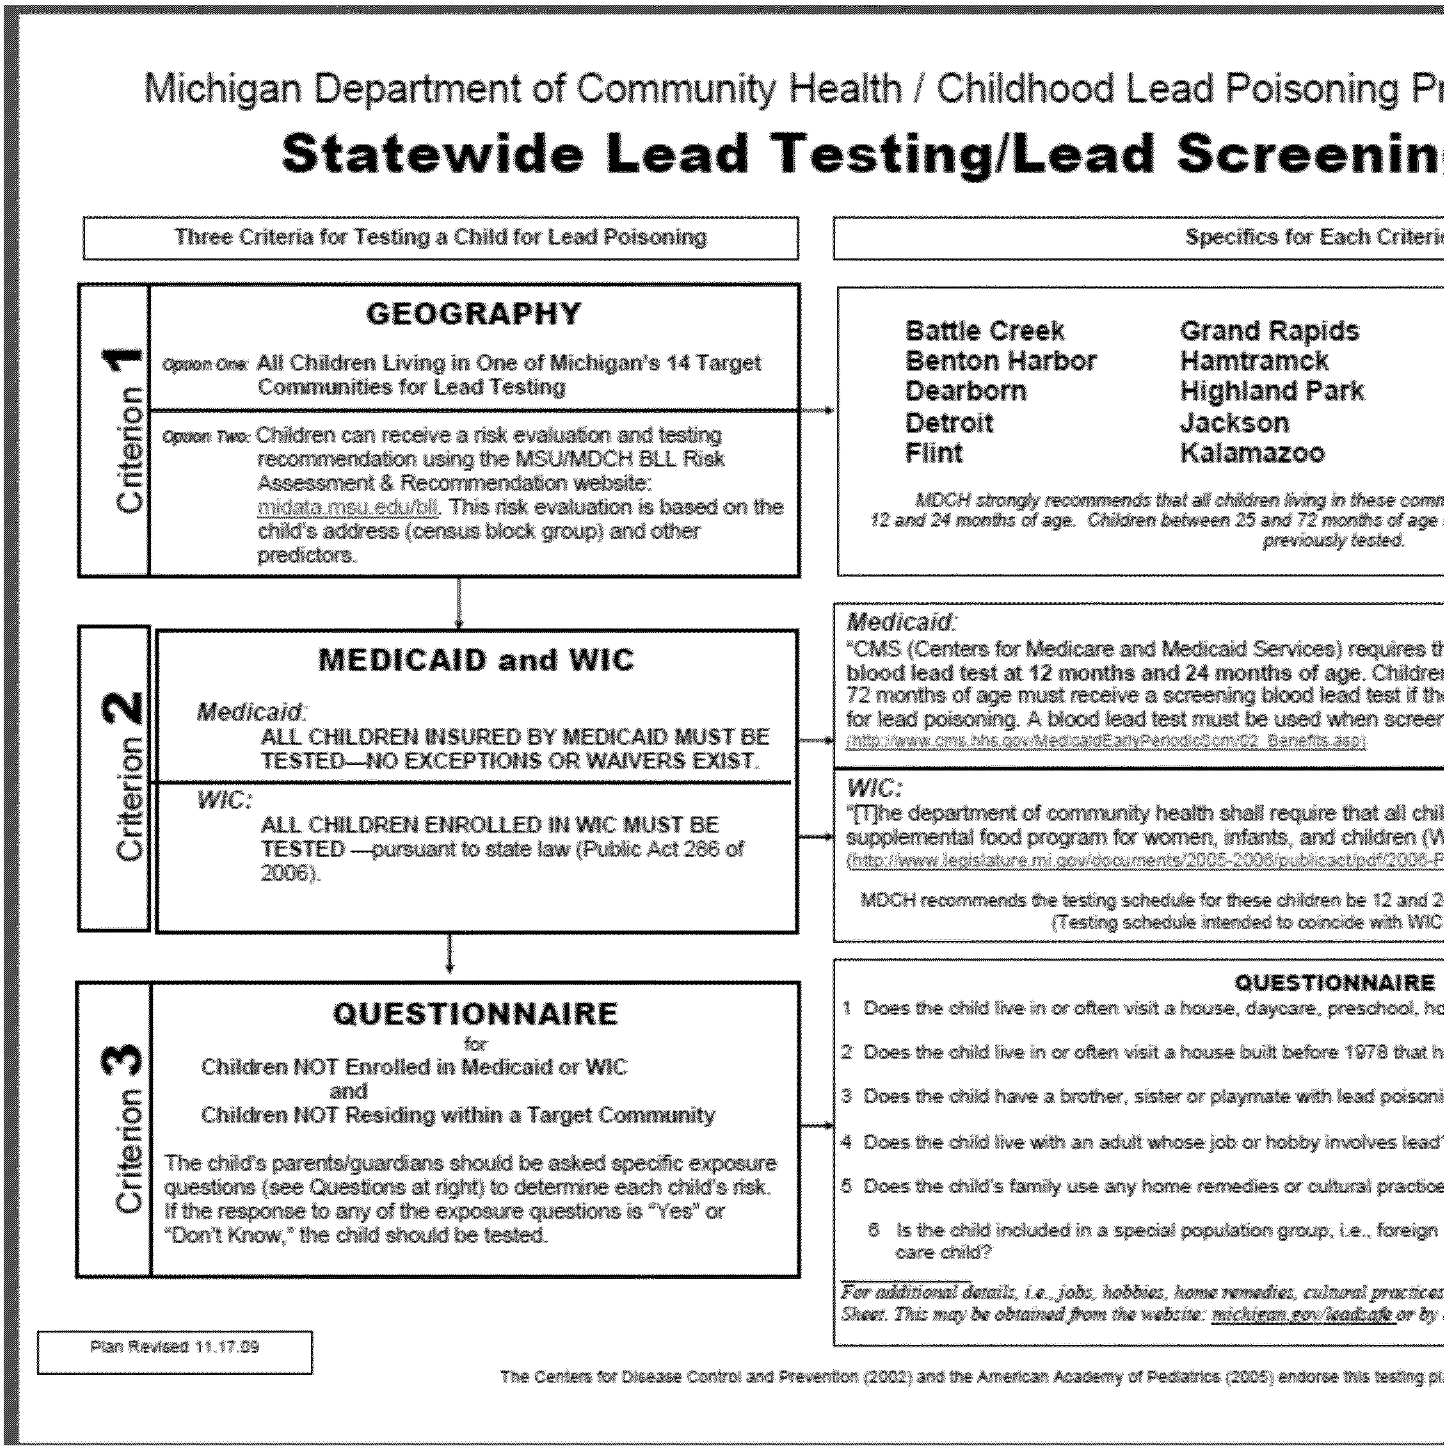
Subject: blood lead levels --> mi considers flint a target community, requires children be tested

Hi Miguel and Jen,

It looks like there should be existing blood lead data for children in Flint. Michigan requires childhood blood lead testing in particular communities (Flint is one of them), as well as for all children on Medicaid and WIC (source: http://www.michigan.gov/documents/mdch/testing-screening071009_287511_7.pdf):



Michigan Department of Community Health / Childhood Lead Poisoning Pr

Statewide Lead Testing/Lead Screenin

Three Criteria for Testing a Child for Lead Poisoning

Specifics for Each Criteri

Criterion 1

GEOGRAPHY

Option One: All Children Living in One of Michigan's 14 Target Communities for Lead Testing

Option Two: Children can receive a risk evaluation and testing recommendation using the MSU/MDCH BLL Risk Assessment & Recommendation website: midata.msu.edu/bll. This risk evaluation is based on the child's address (census block group) and other predictors.

Battle Creek
Benton Harbor
Dearborn
Detroit
Flint

Grand Rapids
Hamtramck
Highland Park
Jackson
Kalamazoo

MDCH strongly recommends that all children living in these comm 12 and 24 months of age. Children between 25 and 72 months of age previously tested.

Criterion 2

MEDICAID and WIC

Medicaid:
ALL CHILDREN INSURED BY MEDICAID MUST BE TESTED—NO EXCEPTIONS OR WAIVERS EXIST.

WIC:
ALL CHILDREN ENROLLED IN WIC MUST BE TESTED —pursuant to state law (Public Act 286 of 2006).

Medicaid:
"CMS (Centers for Medicare and Medicaid Services) requires th **blood lead test at 12 months and 24 months of age. Childre** 72 months of age must receive a screening blood lead test if th for lead poisoning. A blood lead test must be used when screer

Hi Miguel and Jen,

It looks like there should be existing blood lead data for children in Flint. Michigan requires childhood blood lead testing in particular communities (Flint is one of them), as well as for all children on Medicaid and WIC (source: http://www.michigan.gov/documents/mdch/testing-screening071009_287511_7.pdf):

I am sure there are ways to look at the data, but because the high lead period is relatively short and the water quality is so bad, I suspect lots of folks stopped drinking the water like the Walters. Also, I don't think we know how quickly the lead levels went up, so periods of lower lead and higher lead are mixed in over the past year as well as LSL and non-LSL areas. Still, it doesn't hurt to look.

(This story has been updated with a statement issued by Flint Administrator Natasha Henderson.)

FLINT, MI -- A Virginia Tech University professor overseeing research on lead in Flint's drinking water says the results of the city's own testing for lead cannot be trusted.

Professor Marc Edwards, who was scheduled to speak in Flint Tuesday night, Sept. 15, on water sampling by Virginia Tech students and faculty, said water flowing into homes and businesses in Flint is so corrosive that it's eating into lead and lead solder in pipes.

Virginia Tech researchers have said their testing shows a serious problem with lead in Flint water including 10 percent of homes that had 25 parts per billion of lead or more -- far more than the allowable level -- 15 ppb -- set in federal guidelines.

City and state Department of Environmental Quality officials have said those numbers are far higher than Flint's own testing shows, which are lead levels that are within allowable levels.

Edwards said Tuesday that the city's results amount to "smoke and mirrors."

Among the problems Edwards claimed: The city never tested in areas known to be susceptible to high lead levels, never re-sampled homes in 2015 that were found to have high levels in 2014, and failed to notify residents when they did find problems with lead in the water of their homes.

City Administrator Natasha Henderson released a statement today in response to questions based on comments made by Edwards and others.

"Testing was performed by the city of Flint using (U.S. Environmental Protection Agency) and (Michigan Department of Environmental Quality) approved procedures according to regulatory statute," Henderson's statement says.

"In both (two) rounds of testing, over 175 homes were solicited for voluntary participation. Each testing bottle given to residents for sampling contains MDEQ approved instructions for collection. We are currently working with the MDEQ to implement our water optimization plan to add corrosion control to our water and still encourage anyone who would like a free and independent in-home lead test to be performed to schedule one by calling 810-787-6537 or by emailing flintwater@cityofflint.com."

Edwards was joined in a news conference at City Hall with water activists who have advocated that the city end its use of the Flint River as a water source and return to purchasing Lake Huron water from the city of Detroit.

The professor said a return to less-corrosive Lake Huron water would drastically reduce lead levels in tap water within two weeks and nearly eliminate high lead readings after a month.

"This (problem with lead) is occurring because the water is too corrosive," he said. "It has too much salt in it, and there was no plan to control the corrosion" when the city began using the river in April 2014.

"Flint is the only city in American that I'm aware of that does not have a corrosion-control plan in place to stop this kind of problem."

Just this month, as the results of the Virginia Tech water study began to be released, Flint Mayor Dayne Walling said in a news release that the city -- acting on advice from the state Department of Environmental Quality -- would speed up the development of a plan for corrosion control.

The Flint Journal-MLive could not reach Walling for comment on Edwards' remarks Tuesday.

On Monday, Sept 14, the mayor called on Gov. Rick Snyder to supply Flint with $30 million for Flint's infrastructure, including $10 million to replace lead service lines to water customers' homes.

Edwards, who Time Magazine dubbed "The Plumbing Professor" in 2004 and which listed him among the four most important innovators in water from around the world, is among those scheduled to speak during a town hall meeting from 6-8 p.m. Tuesday at Saints of God Church, 2200 Forest Hill Ave.

Among other comments and information released during Tuesdays news conference:

The city's east-west midsection had the highest percentage of water samples that registered more than 15 parts per billion of lead in at least one sample. Thirty percent of 84 test sites registered at least one sample of 15 ppb or more of lead in Wards 5, 6 and 7.

Virginia Tech researchers said the National Science Foundation has agreed to spend $50,000 to fund their one-year study into what they called a "perfect storm" of water distribution system corrosion problems in Flint.

Kettering University Professor Laura Sullivan, a member of Flint's Technical Advisory Committee for water, called on the city to replace all service lines containing lead at no cost to residents and to provide information by the end of this month on where service lines containing lead are located.

Nayyirah Shariff, a representative of the Flint Democracy Defense League, called on the city to distribute free filters to all water customers, saying lead in water here amounts to a "public health crisis."

Flint and Michigan Department of Environmental Quality officials have said lead has not tested above allowable levels in Flint since the city began using the Flint River for drinking water in April 2014.

Brad Wurfel, director of communications for the DEQ, said there is lead in all water where lead service lines and plumbing with lead solder exist.

"The problem isn't new," Wurfel said Tuesday. "It's just news (now, and) a knee-jerk reaction would be an irresponsible response."

The DEQ is preparing a briefing for state and federal officials regarding Flint's lead-in-water issues, the director said.

Jason Lorenz, a spokesman for the city, was not immediately available for comment on Edwards' remarks today or his findings.

Edwards used two water bottles and two iron nails to demonstrate what he said was the corrosiveness of Flint water, showing how the sample of treated river water was far more discolored by a nail than water from the city of Detroit.

"The (Flint) water looks bad, it smells bad, and it tastes bad, and this is part of what people have been complaining about," Edwards said. "If you don't have this problem in Flint, it's because you're lucky."

Lead is a toxic metal that was used for many years in products found in and around homes, according to the U.S. Environmental Protection Agency

"Even at low levels, lead may cause a range of health effects, including behavioral problems and learning disabilities," EPA's website says. "Children 6 years old and under are most at risk because this is when the brain is developing."

Activists urge residents to keep voices heard in Flint water issue

By Roberto Acosta | racosta1@mlive.com The Flint Journal
September 15, 2015 at 10:16 PM, updated September 15, 2015 at 11:01 PM

FLINT, MI – If they want change, Flint resident Melissa Mays said those gathered in the crowd at Saints of God Church in Flint they need to have their voices heard from the city all the way to Lansing and in Washington, D.C.

More than 100 people filled pews inside the church off Forest Hill Avenue on the city's north side to hear Virginia Tech professor Marc Edwards speak about the study conducted by himself and a group of students.

"I'm telling you this was an epically bad decision," said Edwards of the switch from Detroit water to Flint river water, while going over information he discussed during a news conference Tuesday at Flint City Hall.

Research done at Virginia Tech concluded there was a serious problem with lead in Flint water, including 10 percent of homes that had 25 parts per billion of lead or more -- far more than the allowable level -- 15 ppb -- set in federal guidelines, but the city and state Department of Environmental Quality have said water sampling by the city shows lead levels are within state and federal standards.

The testing of samples from more than 200 Flint homes was helped by $50,000 in funding from the National Science Foundation as part of their one-year study being conducted on the city's water system.

He added the Flint water system does not include an inhibitor that would cut down on wear and tear that rust and lead can cause on pipes in the network for city residents, claiming it has caused the system to age more than a decade in less than two years' time.

Edwards was joined by Siddhartha Roy, a civil and environmental engineering doctoral student at Virginia Tech, Curt Guyette, an investigative reporter for the ACLU of Michigan during the town hall meeting organized by Water You Fighting For, the Coalition for Clean Water, and Concerned Pastors for Social Action.

A lawsuit filed by the Coalition for Clean Water that sought to force the city to stop the use of Flint River water for drinking was dismissed earlier in the day by Genesee Circuit Judge Archie L. Hayman.

Trachelle Young, the attorney representing the Coalition for Clean Water, said her clients are considering whether to amend their complaint or to refer the request to the U.S. Attorney's Office.

"My position remains the water is not safe," she said Tuesday.

Edwards has said he would not use the water for drinking or cooking unless it was tested for lead, but he did note there was no evidence to show it could not be used for other duties, such as taking a shower, brushing teeth, watering plants and flushing toilets.

He did share some deep concern for those using the water to mix with formula for babies, stating "No one should be making up formula from flint tap water at this time."

City Administrator Natasha Henderson released a statement today in response to questions based on comments made by Edwards and others.

"Testing was performed by the city of Flint using (U.S. Environmental Protection Agency) and (Michigan Department of Environmental Quality) approved procedures according to regulatory statute," Henderson's statement says.

"In both (two) rounds of testing, over 175 homes were solicited for voluntary participation. Each testing bottle given to residents for sampling contains MDEQ approved instructions for collection. We are currently working with the MDEQ to implement our water optimization plan to add corrosion control to our water and still encourage anyone who would like a free and independent in-home lead test to be performed to schedule one by calling 810-787-6537 or by emailingflintwater@cityofflint.com."

Several in the crowd at Saints of God Church, including LeAnne Walters, questioned testing methods used by the city that included pre-flushing at homes for several minutes that may have led to differing results.

"One of the biggest problems we're having with this is how the state allows lead and copper samples to take place," said Walters, whose been working with Edwards since April after high lead levels in the water at her home, with claims incorrect bottle sizes are being used for testing.

"I wanted to get to the science, because you can't argue with science," she said. Walters and Mays called for residents to keep showing up at meetings and get in touch with local, state and federal legislators about the issue.

"We have made a difference. I've heard so many times that people feel hopeless in this situation, that nobody's listening, that nobody takes us seriously," said Walters. "We are being taken seriously."

Mays said those in attendance need to contact others and come to meetings and gatherings like the one Tuesday evening and contact legislators to show their concerns and voice will not go away, while listing off demands from the Coalition for Clean Water that include a federal investigation into testing, water switched back to Detroit, replacement of lead service lines, the Michigan Department of Environmental Quality provide lead certified filters in each home and the Environmental Protection Agency step in and audit DEQ sampling.

Flint Mayor Dayne Walling has asked for $30 million from the state for the city's water infrastructure, including $10 million for a new program aimed at replacing lead service lines in the city.

"Flood them flood them flood them, make them hear you," said Mays.

http://www.mlive.com/news/flint/index.ssf/2015/09/lawsuit_aimed_at_forcing_flint.html

Lawsuit aimed at forcing Flint to end use of Flint River dismissed

By Ron Fonger | rfonger1@mlive.com The Flint Journal on
September 15, 2015 at 11:22 AM, updated September 15, 2015 at 4:58 PM

FLINT, MI — A lawsuit that sought to force the city to end its use of the Flint River for drinking water has been dismissed by Genesee Circuit Judge Archie Hayman.

Filed by the Coalition for Clean Water, which includes the Concerned Pastors for Social Action, the lawsuit alleged the city "recklessly endangered" the health and safety of residents by ending purchases of treated Lake Huron water from the city of Detroit and by using the Flint River instead as its water source since April 2014.

The coalition lawsuit is not related to a class action lawsuit pending against the city. An injunction issued in that case required the city to lower water rates. The class action suit claims the city improperly raised rates and charges to water customers dating to 2011.

The city issued a news release on the dismissal Tuesday, Sept. 15, saying that, in this case, Hayman determined "that he did not have jurisdiction to provide the relief sought by the plaintiff. All counts of the Coalition's amended complaint were therefore dismissed."

Trachelle Young, the attorney representing the Coalition for Clean Water, said her clients are considering whether to amend their complaint or to refer the request to the U.S. Attorney's Office.

"My position remains the water is not safe," Young said Tuesday, Sept. 15.

Hayman's ruling comes after the city successfully filed to move the water case to federal court, and a judge there denied Young's motion for a preliminary injunction.

The coalition later dropped its federal claim and sought to pursue the case in Genesee County.

After eight months in violation of the Safe Drinking Water Act because of high levels of total trihalomethanes, Flint was recently notified that the violation has been lifted because of lower TTHM readings during testing in 2015.

Mayor Dayne Walling this week asked Gov. Rick Snyder for $30 million for Flint's water infrastructure, including $10 million for a new program aimed at replacing lead service lines in the city.

Researchers from Virginia Tech University have said their testing of homes in Flint shows high levels of lead, but the city and state Department of Environmental Quality have said water sampling by the city shows lead levels are within state and federal standards.

---

http://www.mlive.com/news/flint/index.ssf/2015/09/flint_mayor_asks_governor_for_1.html

Flint mayor asks governor for $10 million to replace lead water pipes

By Ron Fonger | rfonger1@mlive.com The Flint Journal
September 14, 2015 at 8:07 PM, updated September 14, 2015 at 10:45 PM

FLINT, MI — Mayor Dayne Walling is asking Gov. Rick Snyder for $30 million to upgrade Flint's water system, including $10 million to remove lead service pipes and plumbing susceptible to leaching lead.

Walling, speaking to the City Council on Monday, Sept. 14, announced the request, made in a letter to the governor the same day.

"We need every available expert and resource to address Flint's water problems," Walling's letter says.

"Flint's safety is my top priority. Just as the city and state have worked together on public safety, we need additional support for fixing the water problems. We need $30 million in new funds to repair and update the city-wide infrastructure and to assist households in becoming lead-free."

Walling's letter comes the day before a professor from Virginia Tech University is scheduled to speak at a town hall meeting in Flint about the results of a study of lead in the city's drinking water.

The meeting is from 6-8 p.m. Tuesday, Sept. 15, in Saints of God Church, 2200 Forest Hill Ave.

Researchers from Virginia Tech last week advised Flint residents not to drink or cook with tap water here without flushing lines before each use or using a filter to remove lead.

Virginia Tech students and faculty have posted the results of 252 water tests from Flint online, concluding the city has "a very serious lead-in-water problem."

Testing so far has shown 10 percent of the water samples from across the city have 25 parts per billion of lead or more — far more than the allowable level, 15 ppb, set in federal guidelines.

City and state officials have said they have not seen such high lead levels in their own tests of more than 150 homes in the city since April 2014.

Walling spoke about his letter to Snyder as part of a water presentation that included City Administrator Natasha Henderson and Department of Public Works Director Howard Croft.

Croft said the city has made important upgrades to its water treatment and transmission systems in the short time since it began using the Flint River as its water source in April 2014.

The DPW director said the city has a draft copy of a plan for making Flint water less corrosive and less likely to result in high amounts of lead in the water supply.

Walling has been successful in securing state money for Flint's water system previously.

In February, Snyder awarded Flint $2 million to find leaks in city water lines and to replace a wastewater incinerator — moves officials said would free up money for improving the quality of city water.

Walling's request and remarks did not impress Flint Councilman Eric Mays, who left the council table and did not vote to endorse the mayor's letter to the governor.

The council voted 8-0, with Mays absent, to endorse the letter.

Mays called Walling's comments and letter "nothing more than a media show ... a horse and pony show."

Flint council meeting today will include special water presentation

By Ron Fonger | rfonger1@mlive.com The Flint Journal
September 14, 2015 at 12:32 PM, updated September 14, 2015 at 1:56 PM

FLINT, MI -- A special presentation on water will be a part of a City Council meeting at 6 p.m. today, Sept. 14, in the third-floor council chambers in City Hall, 1101 S. Saginaw St.

"The presentation will include the steps taken thus far to address the quality, safety and affordability of the water as well as upcoming plans to make improvements to the water system," the city says in a news release. "This is a public meeting and residents are encouraged to attend."

Flint recently emerged from having been in violation of the Safe Drinking Water Act because of high levels of total trihalomethanes, a byproduct of chlorinating water.

City officials credit changes in the water treatment and distribution systems, including the addition of a $1.6-million granulated carbon filter media, for the improvement.

New questions about lead in drinking water have also been raised recently by a Virginia Tech University study of 277 water samples taken in Flint.

The Virginia Tech testing so far has shown 10 percent of water samples from across the city tested at 25 parts per billion of lead or more -- far more than the allowable level -- 15 ppb -- set in federal guidelines.

City and state officials have said their own tests since April 2014 show the city is in compliance with all regulations on lead and said high readings in some homes are tied to lead or lead solder in service lines and plumbing inside homes.

Flint changed its drinking water source from Lake Huron water supplied by the city of Detroit to the Flint River in April 2014.

Tim,

Some additional info on Flint. A couple of the links are duplicates from yesterday and several are new. Some info from the Town Hall meeting.

Subject: Flint MI: LCR Enforcement Issues
Flint LCR for FOIA 6429-15 (5).pdf
FOIA 15-585 Part 2 55pgs (12).pdf

Mike, Darren, Jeff, Eric, Carol and Miguel and R5 MI/Enforcement personnel (as listed on the R5 webpage).

In this e-mail, I am making you aware of what we know regarding the Flint lead situation.

1) They do not have an approved lead sampling pool. Only 13 of the lowest lead sampled homes from 2014, were resampled in 2015.

The homes sampling high in 2014, were not asked to be resampled.

At best, their program is sending out sampling bottles at random across the city.

2) This message exemplifies the type of site selection, that they are doing to satisfy their high risk LCR monitoring pool site.

That is, none. They are not even hiding it.

http://www.flintneighborhoodsunited.org/drinking-water-testing/.

3) Furthermore, in a video now on the ACLU website, at the end of the interview, Mike Glasgow (Flint LCR program) notes what is perfectly obvious from looking at the MDEQ FOIA materials.

"we threw out bottles everywhere just to collect as many as we can, just to hit our number, and we just turn in every result we get in."

Moreover, they do not have the records to show the homes have lead pipe. ***"we are still looking for the records"***

See video here. Start at 4 minutes and 13 seconds to see the admission.

https://vimeo.com/139882021

4) On top of that, according to my count, MDEQ covered up no fewer than 5 violations in the 2015 sample round. These include:

a) Technical violation in that what they now stamp as the "draft" report (attached) is late (the signed date is 7/28/2015).

It was due 7/10/2015. The final "revised" report is dated 8/20/2015 (also attached), which is 40 days late.

b) Although 87 sites from 2014 were not resampled, no written justification for the site changes was provided in the FOIA materials, and this is required by law.

The statement given today by Flint, that residents were not resampled because they did not want to participate, is contradicted by my conversations with residents.

c) In the original 71 samples Flint submitted late, the lead 90%ile action level was exceeded. MDEQ took the initiative to invalidate 2 samples, dropping Flint below the Action Level.

Flint never requested in writing that any of the samples be invalidated (see the comments written in the box of page 1, FOIA 15-585).

Mike Glasgow says that the 2 high samples were deleted based on the conference call. Only the high samples were scrutinized for meeting the sample pool criteria.

No low samples were investigated. I have the e-mails.

4) The "Draft 7/28/2015" and "revised 8/20/2015" LCR reports, on page 1, check boxes that note Tier 1 sites are not used. MDEQ asks no questions about that. In video Mike admits he has no knowledge of what sites actually have lead pipe or not.

5) Flint did not achieve the minimum number of samples as determined before the sampling round. In his e-mail Mike Glasgow (see below, and see FLINT LCR FOR FOIA…pdf)

acknowledges this will be a technical violation. The draft LCR clearly indicates that the minimum was not achieved. MDEQ responds “we are discussing options” to handle this technical violation. In the August 20th revised final report, even this technical violation magically disappears (see comments box on page 1….).

Adam,

I just sent the last of the samples to the lab today. Unfortunately we did not reach 100 samples. I believe the count I have is 76 total. Since we have had a few more hits this round, we are going to continue to solicit samples for our own informational purposes. I am disappointed in the turnout of sampling, we distributed close to 200 sample bottles. With this monitoring violation will we be required to collect another round of 100 samples?

KEY POINTS:

1) FLINT HAS LOTS OF LEAD PIPE, NO CORROSION CONTROL

TREATMENT, AND HAS HAD NO LEGITIMATE LCR TESTING FOR AT LEAST A YEAR.

2) AMONGST LOW INCOME INFANTS, BREAST FEEDING RATES ARE LOWER, AND FORMULA USE IS HIGHER. MANY FLINTS RESIDENTS CANNOT AFFORD TO FLUSH DUE TO HIGH WATER RATES. THEY CANNOT AFFORD BOTTLED WATER. THIS IS AN UNPRECEDENTED SITUATION AND EPA NEEDS TO TAKE THIS SERIOUSLY. NOW.

3) WE HAVE ONE CHILD WITH ELEVATED BLOOD LEAD ALREADY…IN FACT, THAT IS THE ONLY REASON WE KNOW ABOUT ANY OF THE ABOVE.

4) MDEQ IS STILL PUBLICLY INSISTING FLINT WATER HAS TESTED SAFE, IS SAFE, AND THAT FLINT HAS **NO VIOLATIONS** of any sort.

I believe that someone at HQ or in R5 should immediately take decisive action on this issue to protect the public.

3) Furthermore, in a video now on the ACLU website, at the end of the interview, Mike Glasgow (Flint LCR program) notes what is perfectly obvious from looking at the MDEQ FOIA materials.

"we threw out bottles everywhere just to collect as many as we can, just to hit our number, and we just turn in every result we get in."

Moreover, they do not have the records to show the homes have lead pipe. ***"we are still looking for the records"***

See video here. Start at 4 minutes and 13 seconds to see the admission.
https://vimeo.com/139882021

4) On top of that, according to my count, MDEQ covered up no fewer than 5 violations in the 2015 sample round. These include:

a) Technical violation in that what they now stamp as the "draft" report (attached) is late (the signed date is 7/28/2015).

It was due 7/10/2015. The final "revised" report is dated 8/20/2015 (also attached), which is 40 days late.

b) Although 87 sites from 2014 were not resampled, no written justification for the site changes was provided in the FOIA materials, and this is required by law.

The statement given today by Flint, that residents were not resampled because they did not want to participate, is contradicted by my conversations with residents.

c) In the original 71 samples Flint submitted late, the lead 90%ile action level was exceeded. MDEQ took the initiative to invalidate 2 samples, dropping Flint below the Action Level.

Flint never requested in writing that any of the samples be invalidated (see the comments written in the box of page 1, FOIA 15-585).

Mike Glasgow says that the 2 high samples were deleted based on the conference call. Only the high samples were scrutinized for meeting the sample pool criteria.

No low samples were investigated. I have the e-mails.

4) The “Draft 7/28/2015” and “revised 8/20/2015” LCR reports, on page 1, check boxes that note Tier 1 sites are not used. MDEQ asks no questions about that. In video Mike admits he has no knowledge of what sites actually have lead pipe or not.

5) Flint did not achieve the minimum number of samples as determined before the sampling round. In his e-mail Mike Glasgow (see below, and see FLINT LCR FOR FOIA…pdf) acknowledges this will be a technical violation. The draft LCR clearly indicates that the minimum was not achieved. MDEQ responds “we are discussing options” to handle this technical violation. In the August 20th revised final report, even this technical violation magically disappears (see comments box on page 1….).

Adam,

I just sent the last of the samples to the lab today. Unfortunately we did not reach 100 samples. I believe the count I have is 76 total. Since we have had a few more hits this round, we are going to continue to solicit samples for our own informational purposes. I am disappointed in the turnout of sampling, we distributed close to 200 sample bottles. With this monitoring violation will we be required to collect another round of 100 samples?

KEY POINTS:

1) FLINT HAS LOTS OF LEAD PIPE, NO CORROSION CONTROL TREATMENT, AND HAS HAD NO LEGITIMATE LCR TESTING FOR AT LEAST A YEAR.

2) AMONGST LOW INCOME INFANTS, BREAST FEEDING RATES ARE LOWER, AND FORMULA USE IS HIGHER. MANY FLINTS RESIDENTS CANNOT AFFORD TO FLUSH DUE TO HIGH WATER RATES. THEY CANNOT AFFORD BOTTLED WATER. THIS IS AN UNPRECEDENTED SITUATION AND EPA NEEDS TO TAKE THIS SERIOUSLY. NOW.

3) WE HAVE ONE CHILD WITH ELEVATED BLOOD LEAD ALREADY…IN FACT, THAT IS THE ONLY REASON WE KNOW ABOUT ANY OF THE ABOVE.

4) MDEQ IS STILL PUBLICLY INSISTING FLINT WATER HAS TESTED SAFE, IS SAFE, AND THAT FLINT HAS **NO VIOLATIONS** of any sort.

I believe that someone at HQ or in R5 should immediately take decisive action on this issue to protect the public.

Mike, Darren, Jeff, Eric, Carol and Miguel and R5 MI/Enforcement personnel (as listed on the R5 webpage).

In this e-mail, I am making you aware of what we know regarding the Flint lead situation.

1) They do not have an approved lead sampling pool. Only 13 of the lowest lead sampled homes from 2014, were resampled in 2015.

The homes sampling high in 2014, were not asked to be resampled.

At best, their program is sending out sampling bottles at random across the city.

2) This message exemplifies the type of site selection, that they are doing to satisfy their high risk LCR monitoring pool site.

That is, none. They are not even hiding it.

Lead levels in Flint water spiked after switch to river, state records show

By Ron Fonger | rfonger1@mlive.com
The Flint Journal on September 19, 2015 at 5:50 AM, updated September 19, 2015 at 7:59 AM

FLINT, MI -- City officials insist their own testing shows Flint water is safe and within federal guidelines for lead.

But those same tests also show lead levels have been rising since the city began using the Flint River for water 16 months ago.

The results of Flint's testing for lead since 1992, released by the state Department of Environmental Quality to The Flint Journal-MLive, show 10 percent of homes sampled in the city's most recent testing contained 11 parts per billion or more of lead, with six of 69 samples exceeding the federal lead limit of 15 ppb.

Those are the highest lead levels measured in Flint by the city in more than 20 years, the state data shows.

In contrast, the city's tests of Lake Huron water from Detroit for one 10-year period -- from June 2001 until September 2011 -- resulted in just one of 155 samples registering higher than 15 ppb of lead.

Flint began treating river water in April 2014 after Detroit terminated an expired contract for selling water to the city. The cutoff came after Flint joined Genesee County to form the Karegnondi Water Authority, which is building a new pipeline to Lake Huron, a project that's expected to be completed sometime next year.

City and state officials have pointed to their own testing as evidence that Flint water is safe and under the 15 ppb limit, but have said little about the lead level drifting up.

Marc Edwards, who is supervising separate water testing in Flint by Virginia Tech University, said there's no mistaking the pattern.

"The Flint River -- based on the chemistry -- has an obvious propensity for lead to be released to water," Edwards said. "There should have been red lights flashing (when the city began using the river in April 2014) -- knowing that if you put that water into Flint's system without corrosion control, you're going to see a massive lead release."

That release is what Edwards' testing has shown as 10 percent of homes sampled by students and faculty from Virginia Tech have had lead levels of at least 25 ppb.

Since the testing started, Mayor Dayne Walling announced Flint would speed up development of a plan for reducing corrosiveness of city water and called for $10 million in state funds to begin replacing lead and lead solder in water service lines and plumbing.

Flint Department of Public Works Director Howard Croft would not attribute higher lead levels to the river alone, but said the source of the water is one variable as is the amount of time water is stagnant in pipes.

"Lead is in there. It's always been there," Croft said. "We would like there to be no lead, (but) I'm happy how aggressively we are responding" to what the city has.

Steve Busch, Lansing and Jackson district supervisor in the DEQ's office of drinking water and municipal assistance, said lead testing results vary in many areas and a shift doesn't necessarily show Flint River water is more susceptible to higher lead levels than lake water.

"We see numbers fluctuate with the same treatment and the same water," Busch said. "We have levels go up and down from monitoring round to monitoring round."

Lead is a toxic metal that was used for many year in products found in and around homes, according to the U.S. Environmental Protection Agency. Even at low levels, lead may cause health effects such as behavioral problems and learning disabilities.

Current regulations for lead in water began in 1992 and require a limited amount of testing to measure the degree to which lead leaches into tap water after flowing through lead service lines and lead solder in home plumbing.

If more than 10 percent of tap water samples from water systems exceed 15 ppb, the water system can be required to take steps like making water less corrosive or replacing lead service lines.

Since the EPA announced its lead and copper rule in 1991, Flint has collected 33 samples every six to 36 months but the number of tests increased after the city changed its water source to the river, according to state data.

State records show 100 samples were collected from Flint in the last six months of 2014, showing two sites with readings of more than 15 ppb of lead and 10 percent of homes registering at 6 ppb or more.

From January until June this year, the city collected just 69 samples, a reduction that was allowed because Flint's population had dropped below 100,000, Busch said.

The last time testing by the city showed a higher percentage of water samples above 11 parts per billion was 1992, immediately after new lead and copper rules went into effect.

In that case, the city of Detroit took five years to develop a plan to better control corrosion and lead levels and brought lead levels down from a high of 15 ppb in 10 percent of samples taken in Flint.

KEY POINTS:

1) FLINT HAS LOTS OF LEAD PIPE, NO CORROSION CONTROL TREATMENT, AND HAS HAD NO LEGITIMATE LCR TESTING FOR AT LEAST A YEAR.

2) AMONGST LOW INCOME INFANTS, BREAST FEEDING RATES ARE LOWER, AND FORMULA USE IS HIGHER. MANY

FLINTS RESIDENTS CANNOT AFFORD TO FLUSH DUE TO HIGH WATER RATES. THEY CANNOT AFFORD BOTTLED WATER. THIS IS AN UNPRECEDENTED SITUATION AND EPA NEEDS TO TAKE THIS SERIOUSLY. NOW.

3) WE HAVE ONE CHILD WITH ELEVATED BLOOD LEAD ALREADY…IN FACT, THAT IS THE ONLY REASON WE KNOW ABOUT ANY OF THE ABOVE.

4) MDEQ IS STILL PUBLICLY INSISTING FLINT WATER HAS TESTED SAFE, IS SAFE, AND THAT FLINT HAS **NO VIOLATIONS** of any sort.

I believe that someone at HQ or in R5 should immediately take decisive action on this issue to protect the public.

Subject: Flint MI: LCR Enforcement Issues

Mike, Darren, Jeff, Eric, Carol and Miguel and R5 MI/Enforcement personnel (as listed on the R5 webpage).

In this e-mail, I am making you aware of what we know regarding the Flint lead situation.

1) They do not have an approved lead sampling pool. Only 13 of the lowest lead sampled homes from 2014, were resampled in 2015.

The homes sampling high in 2014, were not asked to be resampled.

At best, their program is sending out sampling bottles at random across the city.

2) This message exemplifies the type of site selection, that they are doing to satisfy their high risk LCR monitoring pool site.

That is, none. They are not even hiding it.

http://www.flintneighborhoodsunited.org/drinking-water-testing/.

3) Furthermore, in a video now on the ACLU website, at the end of the interview, Mike Glasgow (Flint LCR program) notes what is perfectly obvious from looking at the MDEQ FOIA materials.

"we threw out bottles everywhere just to collect as many as we can, just to hit our number, and we just turn in every result we get in."

Moreover, they do not have the records to show the homes have lead pipe. ***"we are still looking for the records"***

See video here. Start at 4 minutes and 13 seconds to see the admission.
https://vimeo.com/139882021

4) On top of that, according to my count, MDEQ covered up no fewer than 5 violations in the 2015 sample round. These include:

a) Technical violation in that what they now stamp as the "draft" report (attached) is late (the signed date is 7/28/2015).

It was due 7/10/2015. The final "revised" report is dated 8/20/2015 (also attached), which is 40 days late.

b) Although 87 sites from 2014 were not resampled, no written justification for the site changes was provided in the FOIA materials, and this is required by law.

The statement given today by Flint, that residents were not resampled because they did not want to participate, is contradicted by my conversations with residents.

c) In the original 71 samples Flint submitted late, the lead 90%ile action level was exceeded. MDEQ took the initiative to invalidate 2 samples, dropping Flint below the Action Level.

Flint never requested in writing that any of the samples be invalidated (see the comments written in the box of page 1, FOIA 15-585).

Mike Glasgow says that the 2 high samples were deleted based on the conference call. Only the high samples were scrutinized for meeting the sample pool criteria.

No low samples were investigated. I have the e-mails.

4) The “Draft 7/28/2015” and “revised 8/20/2015” LCR reports, on page 1, check boxes that note Tier 1 sites are not used. MDEQ asks no questions about that. In video Mike admits he has no knowledge of what sites actually have lead pipe or not.

5) Flint did not achieve the minimum number of samples as determined before the sampling round. In his e-mail Mike Glasgow (see below, and see FLINT LCR FOR FOIA…pdf) acknowledges this will be a technical violation. The draft LCR clearly indicates that the minimum was not achieved. MDEQ responds “we are discussing options” to handle this technical violation. In the August 20th revised final report, even this technical violation magically disappears (see comments box on page 1….).

Adam,

I just sent the last of the samples to the lab today. Unfortunately we did not reach 100 samples. I believe the count I have is 76 total. Since we have had a few more hits this round, we are going to continue to solicit samples for our own informational purposes. I am disappointed in the turnout of sampling, we distributed close to 200 sample bottles. With this monitoring violation will we be required to collect another round of 100 samples?

KEY POINTS:

1) FLINT HAS LOTS OF LEAD PIPE, NO CORROSION CONTROL TREATMENT, AND HAS HAD NO LEGITIMATE LCR TESTING FOR AT LEAST A YEAR.

2) AMONGST LOW INCOME INFANTS, BREAST FEEDING RATES ARE LOWER, AND FORMULA USE IS HIGHER. MANY

KEY POINTS:

1) FLINT HAS LOTS OF LEAD PIPE, NO CORROSION CONTROL TREATMENT, AND HAS HAD NO LEGITIMATE LCR TESTING FOR AT LEAST A YEAR.

2) AMONGST LOW INCOME INFANTS, BREAST FEEDING RATES ARE LOWER, AND FORMULA USE IS HIGHER. MANY FLINTS RESIDENTS CANNOT AFFORD TO FLUSH DUE TO HIGH WATER RATES. THEY CANNOT AFFORD BOTTLED WATER. THIS IS AN UNPRECEDENTED SITUATION AND EPA NEEDS TO TAKE THIS SERIOUSLY. NOW.

3) WE HAVE ONE CHILD WITH ELEVATED BLOOD LEAD ALREADY…IN FACT, THAT IS THE ONLY REASON WE KNOW ABOUT ANY OF THE ABOVE.

4) MDEQ IS STILL PUBLICLY INSISTING FLINT WATER HAS TESTED SAFE, IS SAFE, AND THAT FLINT HAS **NO VIOLATIONS** of any sort.

I believe that someone at HQ or in R5 should immediately take decisive action on this issue to protect the public.

Subject: Flint MI: LCR Enforcement Issues

Mike, Darren, Jeff, Eric, Carol and Miguel and R5 MI/Enforcement personnel (as listed on the R5 webpage).

In this e-mail, I am making you aware of what we know regarding the Flint lead situation.

1) They do not have an approved lead sampling pool. Only 13 of the lowest lead sampled homes from 2014, were resampled in 2015.

The homes sampling high in 2014, were not asked to be resampled.

At best, their program is sending out sampling bottles at random across the city.

2) This message exemplifies the type of site selection, that they are doing to satisfy their high risk LCR monitoring pool site.

That is, none. They are not even hiding it.

http://www.flintneighborhoodsunited.org/drinking-water-testing/.

3) Furthermore, in a video now on the ACLU website, at the end of the interview, Mike Glasgow (Flint LCR program) notes what is perfectly obvious from looking at the MDEQ FOIA materials.

"we threw out bottles everywhere just to collect as many as we can, just to hit our number, and

we just turn in every result we get in."

Moreover, they do not have the records to show the homes have lead pipe. *"we are still looking for the records"*

See video here. Start at 4 minutes and 13 seconds to see the admission.
https://vimeo.com/139882021

4) On top of that, according to my count, MDEQ covered up no fewer than 5 violations in the 2015 sample round. These include:

a) Technical violation in that what they now stamp as the "draft" report (attached) is late (the signed date is 7/28/2015).

It was due 7/10/2015. The final "revised" report is dated 8/20/2015 (also attached), which is 40 days late.

b) Although 87 sites from 2014 were not resampled, no written justification for the site changes was provided in the FOIA materials, and this is required by law.

The statement given today by Flint, that residents were not resampled because they did not want to participate, is contradicted by my conversations with residents.

c) In the original 71 samples Flint submitted late, the lead 90%ile action level was exceeded. MDEQ took the initiative to invalidate 2 samples, dropping Flint below the Action Level.

Flint never requested in writing that any of the samples be invalidated (see the comments written in the box of page 1, FOIA 15-585).

Mike Glasgow says that the 2 high samples were deleted based on the conference call. Only the high samples were scrutinized for meeting the sample pool criteria.

No low samples were investigated. I have the e-mails.

4) The "Draft 7/28/2015" and "revised 8/20/2015" LCR reports, on page 1, check boxes that note Tier 1 sites are not used. MDEQ asks no questions about that. In video Mike admits he has

no knowledge of what sites actually have lead pipe or not.

5) Flint did not achieve the minimum number of samples as determined before the sampling round. In his e-mail Mike Glasgow (see below, and see FLINT LCR FOR FOIA…pdf) acknowledges this will be a technical violation. The draft LCR clearly indicates that the minimum was not achieved. MDEQ responds "we are discussing options" to handle this technical violation. In the August 20th revised final report, even this technical violation magically disappears (see comments box on page 1….).

<image001.png>

KEY POINTS:

1) FLINT HAS LOTS OF LEAD PIPE, NO CORROSION CONTROL TREATMENT, AND HAS HAD NO LEGITIMATE LCR TESTING FOR AT LEAST A YEAR.

2) AMONGST LOW INCOME INFANTS, BREAST FEEDING RATES ARE LOWER, AND FORMULA USE IS HIGHER. MANY FLINTS RESIDENTS CANNOT AFFORD TO FLUSH DUE TO HIGH WATER RATES. THEY CANNOT AFFORD BOTTLED WATER. THIS IS AN UNPRECEDENTED SITUATION AND EPA NEEDS TO TAKE THIS SERIOUSLY. NOW.

3) WE HAVE ONE CHILD WITH ELEVATED BLOOD LEAD ALREADY…IN FACT, THAT IS THE ONLY REASON WE KNOW ABOUT ANY OF THE ABOVE.

4) MDEQ IS STILL PUBLICLY INSISTING FLINT WATER HAS TESTED SAFE, IS SAFE, AND THAT FLINT HAS **NO VIOLATIONS** of any sort.

I believe that someone at HQ or in R5 should immediately take decisive action on this issue to protect the public.

Adam,

I just sent the last of the samples to the lab today. Unfortunately we did not reach 100 samples. I believe the count I have is 76 total. Since we have had a few more hits this round, we are going to continue to solicit samples for our own informational purposes. I am disappointed in the turnout of sampling, we distributed close to 200 sample bottles. With this monitoring violation will we be required to collect another round of 100 samples?

Subject: Fw: Pediatrician's blood lead study and City of Flint response. FYI

This is no surprise. lead lines + no treatment = high lead in water = lead poisoned children.

You have a city that has lead lines and no treatment that is collecting pre-flushing which we know can easily miss very high lead levels. We do nothing to stop that.

We have an independent group taking samples that show much higher lead levels and what do people do? They question the VT data, rather than saying anything about the City's data from sampling that we know can miss the lead and on top of that we just found out that the city may have lied on the reporting forms to DEQ in stating that all of the sites they used had lead service lines when they apparently do not have any information that they could possibly have used to make those determinations. To mean that means you have to throw out both rounds of data unless they can provide the supporting documentation. And since they admitted they do not have it, what do we do? Nothing again?

I can't recall what R5 decided on the MI disinvestments, but I very seriously hope that we did not allow MDEQ NOT to issue violations for failure to submit the LCR reporting forms. It is only by way of having these forms from Flint that we became aware that what they reported for each of the monitoring sites is not true. If I am a lawyer, and someone puts down on a form that every site is a lead line site, and they cannot produce a single piece of information that they used to make the determination that they are lead line sites...isn't that false reporting at a minimum? And when all of this results in a town full of lead-poisoned children, doesn't that mean anything to anyone?

Even worse, absent anything from EPA, MDEQ and the City, other than 'they are in full compliance' other folks have to alert the public to the risk. We now have data from yet another independent group that appears to show that the children are in fact, being poisoned.

At every stage of this process, it seems that we spend more time trying to maintain State/local relationships than we do trying to protect the children. I said this from the very beginning and I will say this again...you don't have to drop a bowling ball off of every building in every city to prove that gravity (and science) will work the same way everywhere. It's basic chemistry.

There is nothing that can be done in the immediate future with respect to treatment that can prevent more children from being further damaged. Someone needs to require that the residents of Flint be provided with water filters until they can fix the treatment.

Sorry for the rant, but I am very upset about this because I told people this was going to be the outcome. I watched this movie before in Washington, DC. and we are heading down the exact same path of denial and delay and meanwhile, the children are being irreparably damaged.

Subject: Pediatrician's blood lead study and City of Flint response. FYI

Pediatrician's from Hurley medical center gave a medical briefing to the mayor, Croft and the City administrator about their blood lead data today.

To summarize what they found, they compared incidence of EBL (> 5 ug/dL) in the time period before and after the switch using their in-house data. Basically repeating my DC Lead study from 2009 methods.

For infants < 15 months, here is what they found.

1) Non-flint residents no change (0.5% pre vs. 0.5% post).

2) The two zip codes where we found the highest lead in water, EBL rose from 1.5% pre-switch to 4.4% after the switch.

3) For the rest of Flint (lower risk zip codes) the EBL incidence rose from 0.6 to 1.1%.

4) For all children less than 5 years old, EBL rose from 2.1% switch to 4.0% post-switch ($p < 0.05$)

5) For all children less than 5 years old, EBL rose from 2.5% pre-switch to 6.3% post-switch in the zip codes with highest water lead risk ($p < 0.05$).

The person said I could tell you the following. What follows are her exact words, not mine. I did put the red underline emphasis in there.

"The meeting included the mayor, Croft, city administrator, sen ananich and doctors. The city folks had a meeting this am with DEQ and EPA who gave them a blessing that they were in compliance with everything - they said all the water experts this am said their is no "corrosivity" issue.

We pushed for a health advisory - even something saying "we are in compliance, but we don't know everything, we want to be safe, follow these precautions. "That would enable mobilization of additional resources. They seemed receptive to that. ?? I'm not sure what will happen - mayor is going to dc this week to see EPA? Croft said he has been sharing information with you. they are not blaming the water source, they are blaming sitting water and old pipes….they said population has decreased and more water is sitting."

The pediatrician's information is below. She said you could call her to verbally confirm what was said at the meeting.

Subject: RE: Pediatrician's blood lead study and City of Flint response. FYI

Hi All – During our meeting yesterday with MDEQ, the Flint Mayor, State Senator &/or Reps and Rep Killdee and staffers from Sen. Peters and Stabenow's offices we discussed the issues at Flint.

Regarding compliance – the discussion focused on the fact that the 2-6month rounds of sampling did not exceed the action level of 15 ug/l. We also discussed the sampling protocols used by MDEQ & Flint which are compliant with the current LCR.

Regarding corrosivity – the discussion focused on the role of orthophosphate as a pipe coating – the statement below is correct in that we did make it clear that it isn't the source water it is the plumbing and the need for CCT. There was discussion about why they didn't do CCT when the switch – answer – conducted the sampling that then indicated the need to do CCT (but still not exceeding the AL of 15). MDEQ also stated that they will require CCT to continue when the switch to the new water source in a few months. (NOTE: a pipeline from Lk Huron is under construction and expected to be completed in the summer of 2016). There was no statement that indicated that corrosion control was not needed, so I'm not sure where folks got the impression that there was "no corrosion issue."

Regarding better outreach/education - We also discussed the need for more outreach and education. MDEQ is partnering with the State/local health dept to work on enhanced education. Based on this discussion I expect they will have a plan shortly. Also, after the meeting I spoke to the Mayor and he had some ideas about how to address the concern that low income individuals are unwilling to flush their lines due to the fact that they would pay more for their water bill. He mentioned two ideas – one targeted to reaching young mothers who may not have the resources or be informed. The idea was to focus on food and diaper banks to educate and possibly provide some bottled water. The other idea was to think about how they could structure the water bill to possibly credit some amount of water. These were just ideas – I have no sense of the efficacy and timing of these ideas. Also, one of the state Senators wondered if they could use USDA's WIC program to provide drink ready formula (no need to mix with water) or a filter. Obviously those issues still need to be discussed with WIC program managers.

Hope this helps. Let me know if you have questions. I'll be on the call today. Thanks

Hi All – During our meeting yesterday with MDEQ, the Flint Mayor, State Senator &/or Reps and Rep Killdee and staffers from Sen. Peters and Stabenow's offices we discussed the issues at Flint.

Regarding compliance – the discussion focused on the fact that the 2-6month rounds of sampling did not exceed the action level of 15 ug/l. We also discussed the sampling protocols used by MDEQ & Flint which are compliant with the current LCR.

Regarding corrosivity – the discussion focused on the role of orthophosphate as a pipe coating – the statement below is correct in that we did make it clear that it isn't the source water it is the plumbing and the need for CCT. There was discussion about why they didn't do CCT when the switch – answer – conducted the sampling that then indicated the need to do CCT (but still not exceeding the AL of 15). MDEQ also stated that they will require CCT to continue when the switch to the new water source in a few months. (NOTE: a pipeline from Lk Huron is under construction and expected to be completed in the summer of 2016). There was no statement that indicated that corrosion control was not needed, so I'm not sure where folks got the impression that there was "no corrosion issue."

Regarding better outreach/education - We also discussed the need for more outreach and education. MDEQ is partnering with the State/local health dept to work on enhanced education. Based on this discussion I expect they will have a plan shortly. Also, after the meeting I spoke to the Mayor and he had some ideas about how to address the concern that low income individuals are unwilling to flush their lines due to the fact that they would pay more for their water bill. He mentioned two ideas – one targeted to reaching young mothers who may not have the resources or be informed. The idea was to focus on food and diaper banks to educate and possibly provide some bottled water. The other idea was to think about how they could structure the water bill to possibly credit some amount of water. These were just ideas – I have no sense of the efficacy and timing of these ideas. Also, one of the state Senators wondered if they could use USDA's WIC program to provide drink ready formula (no need to mix with water) or a filter. Obviously those issues still need to be discussed with WIC program managers.

Hope this helps. Let me know if you have questions. I'll be on the call today. Thanks

For infants < 15 months, here is what they found.

1) Non-flint residents no change (0.5% pre vs. 0.5% post).

2) The two zip codes where we found the highest lead in water, EBL rose from 1.5% pre-switch to 4.4% after the switch.

3) For the rest of Flint (lower risk zip codes) the EBL incidence rose from 0.6 to 1.1%.

4) For all children less than 5 years old, EBL rose from 2.1% switch to 4.0% post-switch ($p < 0.05$)

I don't know who in EPA is saying that, we know a lot about lead corrosion/solubility and there is no way a mid-7's pH water will NOT have a soluble lead problem (without adding a lot of orthophosphate and controlling particulate release), unless they have a PbO2 scale. And they don't have that, because they can't even keep a chlorine residual in parts of the system, and the phosphate they got from Detroit water may (probably) inhibited it before. The sampling results were not taken in a way that either reflects human exposure (which the LCR doesn't) or sampled in a way to characterize what contribution the different plumbing components make to the overall lead risk.

Subject: RE: Pediatrician's blood lead study and City of Flint response. FYI

I know there is a lot of misinformation about the LCR sampling—what the sampling is and isn't. I suspect the health department or medical center people are really confused about the mixed messaging, and of course, the media really complicates things.

Something I would really like, and I don't know if it can be worked out, would be if we (you folks, Darren and I) could have some conversations directly with the health department people and try to give them clear scientific answers about corrosion control, plumbing materials, POU options, lead pipes, sampling (what each kind of sampling means versus another), and help them with the message they need to get to consumers. I'm also very concerned that we find a way to be able to actually inspect and characterize the plumbing layout in a number of homes from which new, controlled water samples can be taken.

People genuinely are confused about sampling, and they don't have a feel for why one set of data differs from another, unless someone can explain it to them. But once that happens, usually they finally get it. I honestly start every talk I give at conferences on sampling with the statement that I can get you any result you want from sampling—missing a problem entirely to finding a problem and making it look worse than even it is, purely by the way I can set up a fairly scientifically defensible sampling scheme. It's all about specifically defining the question you want and need answered. Many of the statements that have come out in the media are true in one context, but misleading in another. That's feeding the confusion. People don't have the objective knowledge to sort out what's relevant and what isn't. The LCR has never been applicable to characterize the risk of any individual home or homes in a water system, but I even know senior folks in CDC who literally think that if a system meets the 90th percentile action level, nobody needs to worry. Even if some guy with a jackhammer is digging up the street right by their LSL, or if a house has been vacant for 4 months and a family with little kids is about to move in…

I'm going through a similar thing (but no compliance issue yet) with some sporadic high Pb and Cu results at a VA hospital in another area of the country. They just replaced some copper pipe with new copper pipe to "solve" some high copper levels at some taps… I've been talking to some really smart engineering folks for VA in DC and they're now thinking differently about setting up long-term sampling at taps with worst-case stagnation sampling, rotating through the rooms. That way they can be sure there isn't a longer-term corrosivity change or legionella from the recirculating hot water that gets thought the auto-mixing taps. And solving the problems with materials replacement or working with the local water utility and not adding their own treatment.

99.9% of normal people don't have any idea about the lead pipes or where it is in the plumbing material, and why it's a risk as long as lead pipes there. But that said, the performance of the water treatment needs the right kind of sampling to characterize its effectiveness, and the residents need to be able to evaluate their own risk and what they can do (if anything) to reduce it. Unfortunately, the regulatory sampling framework is not really set up to do that, as we all have become painfully aware. And if the lead pipes are almost all on the utility side of the curb stop, then they are even more out of the control of the resident, and the residents are even less capable of controlling their own exposure.

Miguel: Tinka doesn't know how someone could come up with that conclusion. She said that no one at the meeting said there wasn't a corrosion problem in Flint. She said it was explained to Congressman Kildee that lead is not in the source water but coming from pipes and fixtures. I don't know how that could be translated into no corrosion issue. Plus, if there weren't a corrosion issue, how would they explain the letter from MDEQ saying their corrosion control is not optimized and why would Flint be planning implementation of phosphate treatment?

Tom - Read Marc's email below. I suggest that someone check with Tinka before this gets out of hand to see what she said, since things often get jumbled in translation or mischaracterized. Obviously, we would not be able to defend a statement that there is not a corrosion problem in Flint.

I don't know who in EPA is saying that, we know a lot about lead corrosion/solubility and there is no way a mid-7's pH water will NOT have a soluble lead problem (without adding a lot of orthophosphate and controlling particulate release), unless they have a PbO2 scale. And they don't have that, because they can't even keep a chlorine residual in parts of the system, and the phosphate they got from Detroit water may (probably) inhibited it before. The sampling results were not taken in a way that either reflects human exposure (which the LCR doesn't) or sampled in a way to characterize what contribution the different plumbing components make to the overall lead risk.

Miguel: Tinka doesn't know how someone could come up with that conclusion. She said that no one at the meeting said there wasn't a corrosion problem in Flint. She said it was explained to Congressman Kildee that lead is not in the source water but coming from pipes and fixtures. I don't know how that could be translated into no corrosion issue. Plus, if there weren't a corrosion issue, how would they explain the letter from MDEQ saying their corrosion control is not optimized and why would Flint be planning implementation of phosphate treatment?

Technical Advisory Team,

I am writing to inform everyone that we have scheduled the next Technical Advisory Committee meeting to be Wednesday October 7th, 2015 from 2:00 – 4:30 pm. We are extending invitations to Marc Edwards of Virginia Tech along with two lead experts from the EPA (Darren Lytle & Michael Schock) to become a part of the technical team and we are hopeful that they will all be present at the upcoming meeting.

At the meeting we will discuss an overview of the City water system, compliance with the Safe Drinking Water Act, lead concerns, corrosion control, water testing, public education, capital improvement plans, the KWA pipeline, and next steps.

I will forward a specific location and agenda in the near future but we are firmly committing to the time and date. As with previous meetings we look forward to this group having positive dialogue that will benefit the community.

Thank you,

This is no surprise. lead lines + no treatment = high lead in water = lead poisoned children.

You have a city that has lead lines and no treatment that is collecting pre-flushing which we know can easily miss very high lead levels. We do nothing to stop that.

We have an independent group taking samples that show much higher lead levels and what do people do? They question the VT data, rather than saying anything about the City's data from sampling that we know can miss the lead and on top of that we just found out that the city may have lied on the reporting forms to DEQ in stating that all of the sites they used had lead service lines when they apparently do not have any information that they could possibly have used to make those determinations. To mean that means you have to throw out both rounds of data unless they can provide the supporting documentation. And since they admitted they do not have it, what do we do? Nothing again?

I can't recall what R5 decided on the MI disinvestments, but I very seriously hope that we did not allow MDEQ NOT to issue violations for failure to submit the LCR reporting forms. It is only by way of having these forms from Flint that we became aware that what they reported for each of the monitoring sites is not true. If I am a lawyer, and someone puts down on a form that every site is a lead line site, and they cannot produce a single piece of information that they used to make the determination that they are lead line sites...isn't that false reporting at a minimum? And when all of this results in a town full of lead-poisoned children, doesn't that mean anything to anyone?

Even worse, absent anything from EPA, MDEQ and the City, other than 'they are in full compliance' other folks have to alert the public to the risk. We now have data from yet another independent group that appears to show that the children are in fact, being poisoned.

At every stage of this process, it seems that we spend more time trying to maintain State/local relationships than we do trying to protect the children. I said this from the very beginning and I will say this again...you don't have to drop a bowling ball off of every building in every city to prove that gravity (and science) will work the same way everywhere. It's basic chemistry.

There is nothing that can be done in the immediate future with respect to treatment that can prevent more children from being further damaged. Someone needs to require that the residents of Flint be provided with water filters until they can fix the treatment.

Sorry for the rant, but I am very upset about this because I told people this was going to be the outcome. I watched this movie before in Washington, DC. and we are heading down the exact same path of denial and delay and meanwhile, the children are being irreparably damaged.

Subject: Pediatrician's blood lead study and City of Flint response. FYI

Pediatrician's from Hurley medical center gave a medical briefing to the mayor, Croft and the City administrator about their blood lead data today.

To summarize what they found, they compared incidence of EBL (> 5 ug/dL) in the time period before and after the switch using their in-house data. Basically repeating my DC Lead study from 2009 methods.

For infants < 15 months, here is what they found.

1) Non-flint residents no change (0.5% pre vs. 0.5% post).

2) The two zip codes where we found the highest lead in water, EBL rose from 1.5% pre-switch to 4.4% after the switch.

3) For the rest of Flint (lower risk zip codes) the EBL incidence rose from 0.6 to 1.1%.

4) For all children less than 5 years old, EBL rose from 2.1% switch to 4.0% post-switch (p < 0.05)

5) For all children less than 5 years old, EBL rose from 2.5% pre-switch to 6.3% post-switch in the zip codes with highest water lead risk (p < 0.05).

The person said I could tell you the following. What follows are her exact words, not mine. I did put the red underline emphasis in there.

"The meeting included the mayor, Croft, city administrator, sen ananich and doctors. The city folks had a meeting this am with DEQ and EPA who gave them a blessing that they were in compliance with everything - they said all the water experts this am said their is no "corrosivity" issue.

We pushed for a health advisory - even something saying "we are in compliance, but we don't know everything, we want to be safe, follow these precautions. "That would enable mobilization of additional resources. They seemed receptive to that. ?? I'm not sure what will happen - mayor is going to dc this week to see EPA? Croft said he has been sharing information with you. they are not blaming the water source, they are blaming sitting water and old pipes….they said population has decreased and more water is sitting."

The pediatrician's information is below. She said you could call her to verbally confirm what was said at the meeting.

Howard;

Thank you for the meeting invitation. However, I am not available to attend the meeting that week. I wish there had been some consultation with Dr. Lytle and myself about our other commitments and our travel availability, before scheduling the meeting. I still will be available to participate overall the advisory process.

I noticed also that the email address for Dr. Lytle appears to have a typographical error in it, but you may have spoken to him on the phone about the meeting. The correct email address is: lytle.darren@epa.gov.

Thank you, again, for the opportunity to participate.

City must abandon Flint River as drinking water source amid lead crisis

The following is an opinion of The Flint Journal Editorial Board.

It's time to abandon the Flint River and go back to Lake Huron for Flint's drinking water.

And it's up to Gov. Rick Snyder to do it.

Flint residents were told they wouldn't notice any difference when officials made the switch April 25, 2014, after nearly 50 years of getting water from the Detroit pipeline.

"The water quality speaks for itself," Flint Mayor Dayne Walling said the day of the switch.

Today, that quality is still speaking and it's sounding worse by the day.

A switch that was made to save the cash-strapped city money has turned into a dangerous waiting game while crews build a new pipeline to Lake Huron.

But with the new pipeline still a year away from completion, Flint residents can no longer be asked to drink water that's safety cannot be guaranteed.

Elevated levels of the chemical TTHM in the water have segued into reports of elevated lead in the water. More Flint infants and children are being found with elevated levels of lead in their blood since the city switched to using the Flint River as its water source, according to a study from a Hurley Children's Hospital doctor.

While scientists debate test results, residents in one of the poorest cities in America are forced to either buy bottled water or take their chances with a system they're no longer confident is even safe.

This switch was made while Flint was under control of a state-appointed emergency manager, and we call upon the governor to make this right for Flint citizens by brokering a return to Detroit water that won't bankrupt the city of Flint.

Flint is in a crisis that was created in no small part by Snyder's hand-picked emergency manager and it is Snyder's job to fix this mess.

Officials have said that returning to Detroit water for the short term is not fiscally sound but that is not enough to justify staying with Flint River water. Flint is in the midst of a full-blown water emergency right now and it is incomprehensible that a solution cannot be found with our fellow Michiganders to deliver healthy water.

There is a lake full of healthy drinking water just an hour away and the pipes already in place to bring it here.

Clean water can be ours again.

Make the switch — now — before it's too late.

Elevated lead found in more Flint kids after water switch, study finds

By Ron Fonger | rfonger1@mlive.com
The Flint Journal on September 24, 2015 at 2:09 PM, updated September 24, 2015 at 4:31 PM

FLINT, MI -- More Flint infants and children are being found with elevated levels of lead in their blood since the city switched to using the Flint River as its water source, according to a new study by a Hurley Medical Center doctor.

The data show that the percentage of Flint infants and children with above average lead levels has nearly doubled citywide, and has nearly tripled among children in "high risk" areas of lead exposure, according to the study.

The research was based on blood samples from more than 1,700 children living in the city, and underscores Flint's struggles with water quality since switching from Lake Huron water in April 2014. Results of the study were delivered to Flint Mayor Dayne Walling and City Administrator Natasha Henderson this week.

The study includes a recommendation that the city end its use of the Flint River as its drinking water source "as soon as possible."

Among its key findings and recommendations:

•□□□□□□□□ The percentage of children 5 years old and younger with more than 5 micrograms per deciliter of lead in their blood increased from 2.1 percent while Flint purchased Lake Huron water from the city of Detroit to 4 percent after the switch to the Flint River.

•□□□□□□□□ The report also recommends that infant formula not be mixed with Flint tap water, that pregnant mothers not use city water, and that lead-clearing filters be distributed here.

•□□□□□□□□ Areas of Flint with the highest lead levels, according to testing by Virginia Tech University, also showed the most drastic increases in elevated lead levels in children, rising from 2.5 percent to 6.3 percent.

•□□□□□□□□ The study recommends the city declare a health advisory that could trigger additional resources from the federal government.

Findings from the study are expected to be discussed at a news conference scheduled for 3 p.m. today, Sept. 24, at Hurley.

In addition to lead researcher Dr. Mona Hanna-Attisha, representatives of the Greater Flint Health Coalition, Mott Children's Health Center, Hamilton Community Health Network and Genesee County Medical Society are also expected to speak about their concerns about the safety of Flint water.

The data from Flint children reveals an alarming increase in lead poisoning, said Hanna-Attisha, director of Hurley's pediatric residency program and an assistant professor in the Department of Pediatrics & Human Development at Michigan State University's College of Human Medicine.

The study used a database, built from blood tests collected from about 150 doctors and health care providers. It compares the lead levels in the blood of children from Jan. 1, 2013, until Sept. 15, 2013, to levels in samples collected from Jan. 1, 2015, until Sept. 15, 2015.

The city began using the Flint River as its drinking water source in April 2014, and testing by both the city and Virginia Tech have shown that lead is increasingly leaching into the city's water system.

City and state officials have said their own testing inside 169 homes in the city since the switch to river water have registered lead levels below the federal threshold of 15 parts per billion of lead.

Treated river water is 19 times more corrosive than Lake Huron water, according to Professor Marc Edwards of Virginia Tech, causing lead and lead solder in water transmission pipes and home plumbing to seep into the water supply.

Although there are measures that can be taken to reduce corrosiveness in water, including the use of phosphates, Flint had no such plan in place.

"This (higher blood lead levels in children) is exactly what you would expect to see when you put highly corrosive water into a city with so much lead plumbing and pipes," Edwards said today.

"If you look at the level of lead in Flint water, (the study is) perfectly consistent with (my) expectations."

Walling announced earlier this month that the city would speed up efforts to develop a corrosion control plan by the end of the year and has asked Gov. Rick Snyder for $10 million to replace water service lines with lead or lead solder in them.

City and state officials have estimated 15,000 homes in Flint have service lines made with lead.

The Flint Journal-MLive could not reach Walling or Henderson for comment on the new study this morning.

On Wednesday, Sept. 23, the mayor said he would issue an advisory and promote ways to minimize residents' exposure to lead such as flushing pipes before drinking city water.

Hanna-Attisha and Dr. Lawrence Reynolds, president and chief executive officer of Mott Children's Health Center, said they met Walling, Henderson and Department of Public Works Director Howard Croft Monday, Sept. 21, and were told that a return to purchasing water from Detroit would bankrupt the city.

The doctors said they are issuing their recommendations, including an end to use of the Flint River as a water source, because the city has so far failed to act.

"It's our professional obligation to care for the children of Flint (and to tell parents) if we know something," Hanna-Attisha said. "Lead poisoning is irreversible. This is not what our community needs. You have to err on the side of caution (and) educate the public."

State Senate Minority Leader Jim Ananich, D-Flint, issued a statement today, calling the findings of the lead study "alarming."

"Our top priority has to be doing everything we can and finding every available resource to ensure access to safe water for Flint residents," Ananich's statement says. "I will be leading an effort to raise state, private and philanthropic resources to deliver filters and clean water into the community as quickly as possible."

Blood lead levels above 5 micrograms per deciliter are considered elevated by the Center for Disease Control and Prevention and the new study says increasing evidence shows no safe blood lead level.

Lead is a toxic metal that was used for many years in products found in and around homes and may cause health effects such as behavioral problems and learning disabilities, according to the U.S. Environmental Protection Agency.

Reynolds said today in addition to the cost of reconnecting Flint to Detroit water, city and state officials must consider the cost of distributing water with higher lead levels than necessary, including the potential for additional attention deficit hyperactivity disorder, lower IQs, and delinquent behavior.

"No amount of lead is good for human beings," he said. "We cannot predict which child will be affected by high lead levels (and) we have a ... risk we can prevent ...

"you can pay now or pay later," he said.

The city began using the Flint River as a water source for the first time in more than 50 years in April 2014 -- a decision made by state-appointed emergency manager Darnell Earley.

Former emergency manager Jerry Ambrose, who replaced Earley, has said returning Flint to the Detroit-supplied Lake Huron water would be cost-prohibitive, resulting in an increase of about 30 percent in water rates.

Walling has also opposed a short-term contract to buy water from Detroit.

Doctors to speak out today on lead in Flint water

By Ron Fonger | rfonger1@mlive.com

The Flint Journal on September 24, 2015 at 12:40 PM, updated September 24, 2015 at 3:24 PM

FLINT, MI -- Representatives of several Flint medical institutions, including Hurley Medical Center and Mott Children's Health Center, say they will discuss their concerns regarding lead levels in the city's drinking water at a news conference today, Sept. 24.

Hurley said in a news release that it will host the groups at the 3 p.m. news conference and that the meeting will also include representatives of the Flint Health Coalition, Hamilton Community Health Network and Genesee County Medical Society.

The news conference comes one day after Mayor Dayne Walling told The Flint Journal-MLive that the city would issue a lead advisory in the wake of the Greater Flint Health Coalition urgently asking the city to take that step.

The Journal could not reach Walling or City Administrator Natasha Henderson for comment today.

Walling and other city officials met with representatives of the coalition this week, hearing their concerns about the safety of Flint water.

The coalition issued a statement saying "not enough was being done to alert the public to potential risks of consuming Flint city water that could lead to elevated levels of lead."

Researchers from Virginia Tech University reported this month that their testing of Flint water in homes shows a far-reaching problem with lead.

Ten percent of Flint homes tested by Virginia Tech had 25 parts per billion of lead or more, far more than the allowable level -- 15 ppb -- set in federal guidelines, according to the university researchers.

City and state officials have said their testing shows Flint's water supply meets all health and safety regulations, never rising above 11 ppb in more than 10 percent of homes during the last 16 months.

Data from the state Department of Environment Quality shows lead levels have spiked since the city began using the Flint River as its water source in April 2014 but remained within federal thresholds for lead.

Flint to issue lead in water warning after push from doctors, health officials

By Ron Fonger | rfonger1@mlive.com

The Flint Journal on September 24, 2015 at 5:50 AM, updated September 24, 2015 at 9:59 AM

FLINT, MI -- The city of Flint is expected to advise its water customers on ways to minimize exposure to lead in its tap water -- particularly for children -- after a group that includes doctors and health officials strongly suggested the step.

Flint Mayor Dayne Walling confirmed the move on Wednesday, Sept. 23, after The Flint Journal-MLive learned the Greater Flint Health Coalition approved a resolution two days prior urgently asking the city to issue the advisory.

Representatives of the coalition met privately with Walling and other city officials to express their concerns about the safety of Flint water, and issued a statement saying "not enough was being done to alert the public to potential risks of consuming Flint city water that could lead to elevated levels of lead."

Walling's statement said the city "will be issuing an advisory" on the matter "in cooperation with health partners promoting ways to minimize the exposure to lead such as flushing pipes when the water has been sitting." He did not specify when the advisory would be issued.

Walling, who earlier this month asked Gov. Rick Snyder for $30 million for Flint's infrastructure, including $10 million to replace lead service lines to homes, said in an email that he "will continue to pursue funding for a comprehensive healthy homes initiative that addresses lead in paint and pipes."

"We have to get the lead out of our community to eliminate the threat of childhood lead poisoning," the statement says. "I am extremely concerned to hear from doctors about any elevated blood lead levels in Flint's children."

The Journal could not immediately reach Walling for more information on the concerns expressed to him by doctors about lead.

Kirk D. Smith, president and chief executive officer of the Greater Flint Health Coalition, and state Senate Minority Leader Jim Ananich, the chairman of the group's board of directors, issued a statement to The Journal about the coalition's recommendation on issuing precautions.

"As a coalition of concerned physicians, health care professionals and county leaders, we are compelled to inform the public when there is a possible threat to their health so they can take appropriate precautions and actions to protect themselves and their families," the joint statement says.

"At our last meeting and in recent days we have heard from numerous physicians who shared strong concerns that not enough was being done to alert the public to potential risks of consuming Flint city water that could lead to elevated levels of lead."

A resolution approved by the nonprofit coalition's board of directors, which includes representatives of Flint area hospitals, universities, physicians and unions, comes after researchers from Virginia Tech University reported their testing here shows a far-reaching problem with lead in water.

Ten percent of Flint homes tested by Virginia Tech had 25 parts per billion of lead or more, far more than the allowable level -- 15 ppb -- set in federal guidelines, according to the university researchers.

City and state officials have said their testing shows Flint's water supply meets all health and safety regulations, never rising above 11 ppb in more than 10 percent of homes during the last 16 months, but data from the state Department of Environment Quality shows lead levels have spiked since the city began using the Flint River as its water source in April 2014.

At the urging of state and federal officials, the city announced three weeks ago that it would speed up the development of plans aimed at making Flint water less corrosive.

Professor Marc Edwards of Virginia Tech has said treated river water is currently far more corrosive than water the city had used for decades -- Lake Huron water that was treated and piped here by the city of Detroit.

Edwards has criticized the city and the state for not having developed a plan for reducing the corrosiveness of Flint's water because an estimated 15,000 homes in the city have lead or lead solder in service lines and plumbing, making the homes much more susceptible to lead leaching into water.

City Councilman Scott Kincaid, also a member of the GFHC, said he supported the organization's request for further action -- particularly after physicians raised concerns about how high lead levels could affect infants and young children.

"I'm supporting the resolution. I think we need to advise people that there is a potential concern," Kincaid said. "Lead isn't good for anybody, but the effect on infants" is especially disturbing.

Although the city has yet to issue its lead advisory, Walling's mention of allowing water to flush through pipes is the same advice given by Virginia Tech earlier this month.

Researchers at the university have also recommended that infants not be fed formula made with unfiltered Flint tap water and that residents who are not flushing water for five minutes before using it for drinking or cooking should use a filter certified to remove lead.

The Journal could not reach Dr. Lawrence Reynolds, president and CEO of Mott Children's Health Center, for comment Wednesday. Other coalition members said Reynolds led the push for additional, quick action by the city.

Lead is a toxic metal that was used for many years in products found in and around homes, according to the U.S. Environmental Protection Agency. Even at low levels, lead may cause health effects such as behavioral problems and learning disabilities.

Current regulations for lead in water began in 1992 and require a limited amount of testing to measure the degree to which lead leaches into tap water after flowing through lead service lines and lead solder in home plumbing.

Flint has struggled with its water quality since switching to the Flint River as its primary water source in April 2014. Previously, the city had purchased water through the city of Detroit, which got its water from Lake Huron.

Flint was required to step up its testing of water in homes after it shifted to the Flint River, which is intended to be a temporary move as the city and Genesee County are partners in building a new water pipeline to Lake Huron through a partnership called the Karegnondi Water Authority.

The city has been using -- and Walling and state emergency managers have supported continuing to use -- the Flint River as a stopgap water source until the KWA pipeline is expected to be completed in 2016.

In state testing of city water samples, Flint has stayed below the federal threshold for lead, with less than 10 percent of tap water samples exceeding 15 ppb.

Water systems can be required to take steps like making water less corrosive or replacing lead service lines if sampling shows such elevated lead levels.

But after the Virginia Tech testing showed lead was much more prevalent than Flint's testing showed, Edwards and U.S. Rep. Dan Kildee each raised doubts about the water testing by the city and DEQ.

Kildee said in a news release Sept. 21 that "the city, DEQ and (U.S. Environmental Protection Agency) have not adequately answered my questions on their testing methods to ensure the safety of Flint's water."

GoFundMe page created by Virginia Tech researcher to buy filters for Flint residents

By Amanda Emery | aemery@mlive.com

The Flint Journal Follow on Twitter on September 23, 2015 at 5:00 AM, updated September 23, 2015 at 5:03 AM

FLINT, MI -- A Virginia Tech University researcher has started a GoFundMe campaign in an effort to purchase lead filters for Flint water customers in need.

Anurag Mantha, a graduate student at Virginia Tech, said he has been in charge of the Flint Water Study Group and the community outreach for the group. Mantha said his job has been to analyze water samples and call people with high levels of lead to tell them their water is unsafe to drink.

"So I have been calling people and they have been telling me that they couldn't afford to buy filters." Mantha said. "That's one of the options we give to the people who have high amounts of lead. We tell them to buy NSF (National Sanitation Foundation) certified filters and they said they couldn't afford to buy them because their water bills were so high already and it was just a financial burden on them."

Virginia Tech researchers have said their testing shows a serious problem with lead in Flint water including 10 percent of homes that had 25 parts per billion of lead or more -- far more than the allowable level -- 15 ppb -- set in federal guidelines.

Mantha said he approached Professor Marc Edwards, who is heading up the study in Flint, and said he wanted to start a GoFundMe campaign to purchase filters for Flint residents in need. He said the campaign's goal is set at $25,000, but he isn't waiting to hit the goal to start helping residents out.

"Once we get things finalized we'll use the first $1,000 that we raise and kick the campaign off in Flint." Mantha said. "So that hopefully people will see that the money they are donating is doing some good."

The first priority in the giveaway will be single mothers, Manth said. He then plans to contact the Concerned Pastors for Social Action to determine the residents who are most in need.

Mantha said the cost of one filter is roughly $40 and he is working with companies to purchase the filters. The NSF filters will remove lead from the water, he said.

As of Tuesday, Sept. 23, the campaign had already raised $985. One-hundred percent of the funds raised will be used to buy the NSF filters.

For more information on the GoFundMe campaign, click here.

Subject: State says data shows no link to Flint River, elevated lead in blood

Greetings!

Just saw the article below, which has the following:

"Angela Minicuci, a spokeswoman for the Michigan Department of Health and Human Services, said blood lead levels in Flint have remained fairly steady for children under 16 years old since the city switched from Lake Huron water to the river."

I am not a statistician, but it struck me as odd that the State is using BLL data from people up to the age of 16 years old to compare to BLL data collected from children up to 5 years old. Doesn't the use of older children and young adults skew those numbers way down (apples to oranges)?

Maybe there's a reason they used the 16 year old cut-off, but most studies and reports that I have read focus on children under 5 or 6 years old, because this is where you find the vast majority of the EBLLs.

Kids In Michigan May Be Drinking Water That's Tainted With Lead (Think Progress)

BY **SAM P.K. COLLINS** SEP 25, 2015 10:59AM

When Flint, Michigan officials changed the source of drinking water from Lake Huron to Lake Flint last spring, they assured residents that safety wouldn't be a concern, even as stories about changes in color, smell of chemicals, and sicknesses circulated through the state and national media outlets.

New research, however, has confirmed the worst, linking the switch in drinking water to a significant increase in the levels of lead found in children's bloodstream. The study, conducted by Dr. Mona Hanna-Attisha of the Pediatric Residency Program Hurley Medical Center, found elevated lead blood levels — surpassing 5 micrograms per deciliter — in 4 percent of Flint youngsters, which is 2 percentage points higher than what they recorded last year.

Researchers drew blood samples from more than 1,700 children five years of age and younger and analyzed two groups of samples: those taken before and after the switch. They also collected data from children living in the neighboring Genesee County, which still gets its water from the Detroit water system. Those test results found no changes in lead/blood levels among children living in the Genesee area.

Representatives of the Greater Flint Health Coalition, a group dedicated to improving the quality of the community health care system, released a statement calling on local lawmakers to issue an official warning to residents about the dangers of the drinking water.

"The findings released today are alarming. Our top priority has to be doing everything we can and finding every available resource to ensure access to safe water for Flint residents," Michigan State Senate Minority Leader Jim Ananich (D-Flint) said in a statement. "I will be leading an effort to raise state, private and philanthropic resources to deliver filters and clean water into the community as quickly as possible. We must act with urgency to protect Flint residents, especially those most vulnerable to the negative health impacts of lead: children," Ananich, also chair of the Greater Flint Health Coalition, added.

State regulators quickly decried the study, calling concerns about Flint's drinking water "near hysteria." Though Brad Wurfel, spokesperson at the Department of Environmental Quality, told U.S. News the drinking water met state and federal standards, he acknowledged that the aging water pipes haven't been maintained in more than 40 years.

The recent findings build on research previously conducted by scientists at Virginia Tech (VT) in August during which they collected and analyzed lead levels in 300 Flint homes. The researchers said the water in that area was five times more corrosive than other liquid sources in surrounding areas. VT Civil and environmental engineering professor Marc Edwards cited the study at a press conference earlier this month where he warned Flint residents that the water posed a significant danger to public health, unless it's properly filtered.

"This [problem with lead] is occurring because the water is too corrosive," Edwards said. "It has too much salt in it, and there was no plan to control the corrosion when the city began using the river in April 2014. Flint is the only city in American that I'm aware of that does not have a corrosion-control plan in place to stop this kind of problem."

Once lead enters the bloodstream via inhalation of dust, ingestion of food, drinking of water that flows through lead pipes, or hand to mouth activity, it travels to the nerves, kidneys, brain, muscles, and heart. In children and adults, the lead can be stored in the bones and teeth for decades before flowing into the bloodstream again and further damaging organs.

Long-term exposure to lead can cause blood anemia, colic, kidney damage, muscle weakness, brain damage, and death. Left unabated, lead in the bloodstream also affects reaction time, memory, and retention of new information. Hanna-Atisha's report said evidence supported the likelihood of decreased IQ among youngsters with lead/blood levels as low as 4 micrograms per deciliter.

The media shed light on the perils of lead exposure earlier this year in the days after Freddie Gray died under mysterious circumstances while in police custody. In 2008, Gray's family filed a lawsuit against Stanley Rochkind, the owner of a home they rented for four years, arguing that the children's exposure to the substance played a significant part in their educational, behavioral and medical problems — including attention-deficit hyperactivity disorder. The residence in question didn't undergo renovations when Baltimore City officials banned the use of lead-based paint in the 1970s.

On Friday, Hanna-Attisha made an appeal to Michigan lawmakers to prevent similar folly, pointing to the long-term public health effects of lead exposure. She said the issue could no longer be ignored. "It's our professional obligation to care for the children of Flint if we know something," Hanna-Attisha told the Associated Press. "Lead poisoning is irreversible. This is not what our community needs. You have to err on the side of caution [and] educate the public."

Area doctors urge seniors, children, pregnant women to stop drinking Flint water now

BY NICKY ZIZAZA THURSDAY, SEPTEMBER 24TH 2015

FLINT — Today at Hurley Medical Center, doctors warned the public that lead levels in Flint water are too high and many residents should stop drinking it immediately.

Hurley did their own study of Flint water. They have advised senior citizens, children, and pregnant women to stop drinking Flint water right now or they could face irreversible damage. This damage could include memory loss or lowered IQ.

They found double the acceptable amount of lead in Flint water. They tested the specific zip codes done in the recent Virginia Tech study and found excessive blood lead levels in children and babies.

This will affect them not only now, but for decades to come, doctors say. They are advising people to use lead filters.

The head of the Genesee County Health Department, Mark Valacak, said that just looking at children won't identify any of the issues. A blood test is the only way to know for certain.

Dr. Mona Hanna-Attisha, who ran the study, says, "This is not what our community needs."

The Virginia Tech study showed that Flint River water was specifically causing lead in old pipes to be released.

A gofundme account was recently set up by the Virginia Tech group, with the intent of buying the citizens of Flint filters that can remove the lead from the water.

Congressman Dan Kildee issued the following statement:

"Immediate action needs to be taken by the State of Michigan to ensure that relief is provided to people who are concerned about lead levels in their water. Today as part of my ongoing efforts, I talked with the EPA Region 5 Administrator about the State of Michigan providing emergency assistance, including lead-clearing filters and bottled water, until a more permanent solution can be determined.

"This new study by the medical community also raises additional doubts about prior water testing done by the DEQ and EPA that stated the water was in compliance with federal law. I have been completely unsatisfied with their answers to my questions regarding their testing methodology, which is why I have called for additional immediate independent and scientific testing to be done."

Senate Minority Leader Jim Ananich issued the following statement:

"The findings released today are alarming. Our top priority has to be doing everything we can and finding every available resource to ensure access to safe water for Flint residents. I will be leading an effort to raise state, private and philanthropic resources to deliver filters and clean water into the community as quickly as possible.

We must act with urgency to protect Flint residents, especially those most vulnerable to the negative health impacts of lead: children. Anyone with concerns about their water should visit flintwaterinfo.com and contact their physician or the Genesee County Health Department immediately."

Did Flint, Michigan, Just Lead Poison Its Children? Doctors Think So.

By: Russell Saunders 09.24.156:10 PM ET

Since the city switched from Lake Huron to the Flint River as a water source, its children's lead levels have doubled.

According to researchers in Flint, Michigan, blood tests have revealed a distressing conclusion—the tap water residents are drinking is causing elevated lead levels in the city's children.

A new study headed by Dr. Mona Hanna-Attisha, a researcher and director of the pediatric residency program at Hurley Medical Center, compared blood tests taken over a span of months in 2013 with samples taken over a similar span this year. During the time between, the city of Flint changed the source of its drinking water from Lake Huron to treated water from the Flint River.

What they found by comparing the samples is that the percentage of children with lead levels over the acceptable limit nearly doubled after the change. In 2013, about 2 percent of tests had results over 5 micrograms per deciliter (the current "safe" cut-off level, above which steps to identify and mitigate the source of lead exposure are recommended). About 4 percent of the later samples revealed elevated levels. Areas that yielded the highest blood levels had an increase in abnormal samples from 2.5 percent to 6.3 percent.

The consequences of increased lead exposure, especially for younger children, can be dire. Symptoms can include developmental delays, irritability and sluggishness, as well as gastrointestinal problems like poor appetite, abdominal pain, and vomiting. Newborns can experience not only slowed development, but slowed growth.

The new study recommends that Flint city water not be used to mix infant formula, or consumed by pregnant women.

The reason the new water source may be contributing to these elevated lead levels does not have to do with the lead content of the river water itself, but rather its effects on the lead pipes that approximately 15,000 homes in the city are reported to have.

A group of volunteer researchers from Virginia Tech University have been doing ongoing work on the safety of Flint drinking water. Their lead investigator, 2007 MacArthur fellow Dr. Marc Edwards, has noted that treated Flint River water is 19 times as corrosive as water from Lake Huron. This causes the treated water to leach lead from pipes and soldering.

In a separate report, the Virginia Tech team analyzed Flint city water directly and found that 42 percent of the 120 samples collected had lead levels greater than 5 parts per billion, and 20 percent had levels about 15 ppd, the cut-off at which the Environmental Protection Agency requires action.

What is to be done about this problem remains to be seen. Dr. Hanna-Attisha has said that city officials told her a return to Lake Huron water is not financially feasible for Flint. The mayor is asking the state for $10 million in funds to replace lead water service lines.

City must abandon Flint River as drinking water source amid lead crisis

The following is an opinion of The Flint Journal Editorial Board.

It's time to abandon the Flint River and go back to Lake Huron for Flint's drinking water.

And it's up to Gov. Rick Snyder to do it.

Flint residents were told they wouldn't notice any difference when officials made the switch April 25, 2014, after nearly 50 years of getting water from the Detroit pipeline.

"The water quality speaks for itself," Flint Mayor Dayne Walling said the day of the switch.

Today, that quality is still speaking and it's sounding worse by the day.

A switch that was made to save the cash-strapped city money has turned into a dangerous waiting game while crews build a new pipeline to Lake Huron.

But with the new pipeline still a year away from completion, Flint residents can no longer be asked to drink water that's safety cannot be guaranteed.

Elevated levels of the chemical TTHM in the water have segued into reports of elevated lead in the water. More Flint infants and children are being found with elevated levels of lead in their blood since the city switched to using the Flint River as its water source, according to a study from a Hurley Children's Hospital doctor.

While scientists debate test results, residents in one of the poorest cities in America are forced to either buy bottled water or take their chances with a system they're no longer confident is even safe.

This switch was made while Flint was under control of a state-appointed emergency manager, and we call upon the governor to make this right for Flint citizens by brokering a return to Detroit water that won't bankrupt the city of Flint.

Flint is in a crisis that was created in no small part by Snyder's hand-picked emergency manager and it is Snyder's job to fix this mess.

Officials have said that returning to Detroit water for the short term is not fiscally sound but that is not enough to justify staying with Flint River water. Flint is in the midst of a full-blown water emergency right now and it is incomprehensible that a solution cannot be found with our fellow Michiganders to deliver healthy water.

There is a lake full of healthy drinking water just an hour away and the pipes already in place to bring it here.

Clean water can be ours again.

Make the switch — now — before it's too late.

---

Elevated lead found in more Flint kids after water switch, study finds

By Ron Fonger | rfonger1@mlive.com
The Flint Journal on September 24, 2015 at 2:09 PM, updated September 24, 2015 at 4:31 PM

FLINT, MI -- More Flint infants and children are being found with elevated levels of lead in their blood since the city switched to using the Flint River as its water source, according to a new study by a Hurley Medical Center doctor.

The data show that the percentage of Flint infants and children with above average lead levels has nearly doubled citywide, and has nearly tripled among children in "high risk" areas of lead exposure, according to the study.

The research was based on blood samples from more than 1,700 children living in the city, and underscores Flint's struggles with water quality since switching from Lake Huron water in April 2014. Results of the study were delivered to Flint Mayor Dayne Walling and City Administrator Natasha Henderson this week.

The study includes a recommendation that the city end its use of the Flint River as its drinking water source "as soon as possible."

Among its key findings and recommendations:

- The percentage of children 5 years old and younger with more than 5 micrograms per deciliter of lead in their blood increased from 2.1 percent while Flint purchased Lake Huron water from the city of Detroit to 4 percent after the switch to the Flint River.

- The report also recommends that infant formula not be mixed with Flint tap water, that pregnant mothers not use city water, and that lead-clearing filters be distributed here.

- Areas of Flint with the highest lead levels, according to testing by Virginia Tech University, also showed the most drastic increases in elevated lead levels in children, rising from 2.5 percent to 6.3 percent.

- The study recommends the city declare a health advisory that could trigger additional resources from the federal government.

Findings from the study are expected to be discussed at a news conference scheduled for 3 p.m. today, Sept. 24, at Hurley.

In addition to lead researcher Dr. Mona Hanna-Attisha, representatives of the Greater Flint Health Coalition, Mott Children's Health Center, Hamilton Community Health Network and Genesee County Medical Society are also expected to speak about their concerns about the safety of Flint water.

The data from Flint children reveals an alarming increase in lead poisoning, said Hanna-Attisha, director of Hurley's pediatric residency program and an assistant professor in the Department of Pediatrics & Human Development at Michigan State University's College of Human Medicine.

The study used a database, built from blood tests collected from about 150 doctors and health care providers. It compares the lead levels in the blood of children from Jan. 1, 2013, until Sept. 15, 2013, to levels in samples collected from Jan. 1, 2015, until Sept. 15, 2015.

The city began using the Flint River as its drinking water source in April 2014, and testing by both the city and Virginia Tech have shown that lead is increasingly leaching into the city's water system.

City and state officials have said their own testing inside 169 homes in the city since the switch to river water have registered lead levels below the federal threshold of 15 parts per billion of lead.

Treated river water is 19 times more corrosive than Lake Huron water, according to Professor Marc Edwards of Virginia Tech, causing lead and lead solder in water transmission pipes and home plumbing to seep into the water supply.

Although there are measures that can be taken to reduce corrosiveness in water, including the use of phosphates, Flint had no such plan in place.

"This (higher blood lead levels in children) is exactly what you would expect to see when you put highly corrosive water into a city with so much lead plumbing and pipes," Edwards said today.

"If you look at the level of lead in Flint water, (the study is) perfectly consistent with (my) expectations."

Walling announced earlier this month that the city would speed up efforts to develop a corrosion control plan by the end of the year and has asked Gov. Rick Snyder for $10 million to replace water service lines with lead or lead solder in them.

City and state officials have estimated 15,000 homes in Flint have service lines made with lead.

The Flint Journal-MLive could not reach Walling or Henderson for comment on the new study this morning.

On Wednesday, Sept. 23, the mayor said he would issue an advisory and promote ways to minimize residents' exposure to lead such as flushing pipes before drinking city water.

Hanna-Attisha and Dr. Lawrence Reynolds, president and chief executive officer of Mott Children's Health Center, said they met Walling, Henderson and Department of Public Works Director Howard Croft Monday, Sept. 21, and were told that a return to purchasing water from Detroit would bankrupt the city.

The doctors said they are issuing their recommendations, including an end to use of the Flint River as a water source, because the city has so far failed to act.

"It's our professional obligation to care for the children of Flint (and to tell parents) if we know something," Hanna-Attisha said. "Lead poisoning is irreversible. This is not what our community needs. You have to err on the side of caution (and) educate the public."

State Senate Minority Leader Jim Ananich, D-Flint, issued a statement today, calling the findings of the lead study "alarming."

"Our top priority has to be doing everything we can and finding every available resource to ensure access to safe water for Flint residents," Ananich's statement says. "I will be leading an effort to raise state, private and philanthropic resources to deliver filters and clean water into the community as quickly as possible."

Blood lead levels above 5 micrograms per deciliter are considered elevated by the Center for Disease Control and Prevention and the new study says increasing evidence shows no safe blood lead level.

Lead is a toxic metal that was used for many years in products found in and around homes and may cause health effects such as behavioral problems and learning disabilities, according to the U.S. Environmental Protection Agency.

Reynolds said today in addition to the cost of reconnecting Flint to Detroit water, city and state officials must consider the cost of distributing water with higher lead levels than necessary, including the potential for additional attention deficit hyperactivity disorder, lower IQs, and delinquent behavior.

"No amount of lead is good for human beings," he said. "We cannot predict which child will be affected by high lead levels (and) we have a ... risk we can prevent ...

"you can pay now or pay later," he said.

The city began using the Flint River as a water source for the first time in more than 50 years in April 2014 -- a decision made by state-appointed emergency manager Darnell Earley.

Former emergency manager Jerry Ambrose, who replaced Earley, has said returning Flint to the Detroit-supplied Lake Huron water would be cost-prohibitive, resulting in an increase of about 30 percent in water rates.

Walling has also opposed a short-term contract to buy water from Detroit.

Doctors to speak out today on lead in Flint water

By Ron Fonger | rfonger1@mlive.com

The Flint Journal on September 24, 2015 at 12:40 PM, updated September 24, 2015 at 3:24 PM

FLINT, MI -- Representatives of several Flint medical institutions, including Hurley Medical Center and Mott Children's Health Center, say they will discuss their concerns regarding lead levels in the city's drinking water at a news conference today, Sept. 24.

Hurley said in a news release that it will host the groups at the 3 p.m. news conference and that the meeting will also include representatives of the Flint Health Coalition, Hamilton Community Health Network and Genesee County Medical Society.

The news conference comes one day after Mayor Dayne Walling told The Flint Journal-MLive that the city would issue a lead advisory in the wake of the Greater Flint Health Coalition urgently asking the city to take that step.

The Journal could not reach Walling or City Administrator Natasha Henderson for comment today.

Walling and other city officials met with representatives of the coalition this week, hearing their concerns about the safety of Flint water.

The coalition issued a statement saying "not enough was being done to alert the public to potential risks of consuming Flint city water that could lead to elevated levels of lead."

Researchers from Virginia Tech University reported this month that their testing of Flint water in homes shows a far-reaching problem with lead.

Ten percent of Flint homes tested by Virginia Tech had 25 parts per billion of lead or more, far more than the allowable level -- 15 ppb -- set in federal guidelines, according to the university researchers.

City and state officials have said their testing shows Flint's water supply meets all health and safety regulations, never rising above 11 ppb in more than 10 percent of homes during the last 16 months.

Data from the state Department of Environment Quality shows lead levels have spiked since the city began using the Flint River as its water source in April 2014 but remained within federal thresholds for lead.

Flint to issue lead in water warning after push from doctors, health officials

By Ron Fonger | rfonger1@mlive.com

The Flint Journal on September 24, 2015 at 5:50 AM, updated September 24, 2015 at 9:59 AM

FLINT, MI -- The city of Flint is expected to advise its water customers on ways to minimize exposure to lead in its tap water -- particularly for children -- after a group that includes doctors and health officials strongly suggested the step.

Flint Mayor Dayne Walling confirmed the move on Wednesday, Sept. 23, after The Flint Journal-MLive learned the Greater Flint Health Coalition approved a resolution two days prior urgently asking the city to issue the advisory.

Representatives of the coalition met privately with Walling and other city officials to express their concerns about the safety of Flint water, and issued a statement saying "not enough was being done to alert the public to potential risks of consuming Flint city water that could lead to elevated levels of lead."

Walling's statement said the city "will be issuing an advisory" on the matter "in cooperation with health partners promoting ways to minimize the exposure to lead such as flushing pipes when the water has been sitting." He did not specify when the advisory would be issued.

Walling, who earlier this month asked Gov. Rick Snyder for $30 million for Flint's infrastructure, including $10 million to replace lead service lines to homes, said in an email that he "will continue to pursue funding for a comprehensive healthy homes initiative that addresses lead in paint and pipes."

"We have to get the lead out of our community to eliminate the threat of childhood lead poisoning," the statement says. "I am extremely concerned to hear from doctors about any elevated blood lead levels in Flint's children."

The Journal could not immediately reach Walling for more information on the concerns expressed to him by doctors about lead.

Kirk D. Smith, president and chief executive officer of the Greater Flint Health Coalition, and state Senate Minority Leader Jim Ananich, the chairman of the group's board of directors, issued a statement to The Journal about the coalition's recommendation on issuing precautions.

"As a coalition of concerned physicians, health care professionals and county leaders, we are compelled to inform the public when there is a possible threat to their health so they can take appropriate precautions and actions to protect themselves and their families," the joint statement says.

"At our last meeting and in recent days we have heard from numerous physicians who shared strong concerns that not enough was being done to alert the public to potential risks of consuming Flint city water that could lead to elevated levels of lead."

A resolution approved by the nonprofit coalition's board of directors, which includes representatives of Flint area hospitals, universities, physicians and unions, comes after researchers from Virginia Tech University reported their testing here shows a far-reaching problem with lead in water.

Ten percent of Flint homes tested by Virginia Tech had 25 parts per billion of lead or more, far more than the allowable level -- 15 ppb -- set in federal guidelines, according to the university researchers.

City and state officials have said their testing shows Flint's water supply meets all health and safety regulations, never rising above 11 ppb in more than 10 percent of homes during the last 16 months, but data from the state Department of Environment Quality shows lead levels have spiked since the city began using the Flint River as its water source in April 2014.

At the urging of state and federal officials, the city announced three weeks ago that it would speed up the development of plans aimed at making Flint water less corrosive.

Professor Marc Edwards of Virginia Tech has said treated river water is currently far more corrosive than water the city had used for decades -- Lake Huron water that was treated and piped here by the city of Detroit.

Edwards has criticized the city and the state for not having developed a plan for reducing the corrosiveness of Flint's water because an estimated 15,000 homes in the city have lead or lead solder in service lines and plumbing, making the homes much more susceptible to lead leaching into water.

City Councilman Scott Kincaid, also a member of the GFHC, said he supported the organization's request for further action -- particularly after physicians raised concerns about how high lead levels could affect infants and young children.

"I'm supporting the resolution. I think we need to advise people that there is a potential concern," Kincaid said. "Lead isn't good for anybody, but the effect on infants" is especially disturbing.

Although the city has yet to issue its lead advisory, Walling's mention of allowing water to flush through pipes is the same advice given by Virginia Tech earlier this month.

Researchers at the university have also recommended that infants not be fed formula made with unfiltered Flint tap water and that residents who are not flushing water for five minutes before using it for drinking or cooking should use a filter certified to remove lead.

The Journal could not reach Dr. Lawrence Reynolds, president and CEO of Mott Children's Health Center, for comment Wednesday. Other coalition members said Reynolds led the push for additional, quick action by the city.

Lead is a toxic metal that was used for many years in products found in and around homes, according to the U.S. Environmental Protection Agency. Even at low levels, lead may cause health effects such as behavioral problems and learning disabilities.

Current regulations for lead in water began in 1992 and require a limited amount of testing to measure the degree to which lead leaches into tap water after flowing through lead service lines and lead solder in home plumbing.

Flint has struggled with its water quality since switching to the Flint River as its primary water source in April 2014. Previously, the city had purchased water through the city of Detroit, which got its water from Lake Huron.

Flint was required to step up its testing of water in homes after it shifted to the Flint River, which is intended to be a temporary move as the city and Genesee County are partners in building a new water pipeline to Lake Huron through a partnership called the Karegnondi Water Authority.

The city has been using -- and Walling and state emergency managers have supported continuing to use -- the Flint River as a stopgap water source until the KWA pipeline is expected to be completed in 2016.

In state testing of city water samples, Flint has stayed below the federal threshold for lead, with less than 10 percent of tap water samples exceeding 15 ppb.

Water systems can be required to take steps like making water less corrosive or replacing lead service lines if sampling shows such elevated lead levels.

But after the Virginia Tech testing showed lead was much more prevalent than Flint's testing showed, Edwards and U.S. Rep. Dan Kildee each raised doubts about the water testing by the city and DEQ.

Kildee said in a news release Sept. 21 that "the city, DEQ and (U.S. Environmental Protection Agency) have not adequately answered my questions on their testing methods to ensure the safety of Flint's water."

GoFundMe page created by Virginia Tech researcher to buy filters for Flint residents

By Amanda Emery | aemery@mlive.com

The Flint Journal Follow on Twitter on September 23, 2015 at 5:00 AM, updated September 23, 2015 at 5:03 AM

FLINT, MI -- A Virginia Tech University researcher has started a GoFundMe campaign in an effort to purchase lead filters for Flint water customers in need.

Anurag Mantha, a graduate student at Virginia Tech, said he has been in charge of the Flint Water Study Group and the community outreach for the group. Mantha said his job has been to analyze water samples and call people with high levels of lead to tell them their water is unsafe to drink.

"So I have been calling people and they have been telling me that they couldn't afford to buy filters." Mantha said. "That's one of the options we give to the people who have high amounts of lead. We tell them to buy NSF (National Sanitation Foundation) certified filters and they said they couldn't afford to buy them because their water bills were so high already and it was just a financial burden on them."

Virginia Tech researchers have said their testing shows a serious problem with lead in Flint water including 10 percent of homes that had 25 parts per billion of lead or more -- far more than the allowable level -- 15 ppb -- set in federal guidelines.

Mantha said he approached Professor Marc Edwards, who is heading up the study in Flint, and said he wanted to start a GoFundMe campaign to purchase filters for Flint residents in need. He said the campaign's goal is set at $25,000, but he isn't waiting to hit the goal to start helping residents out.

"Once we get things finalized we'll use the first $1,000 that we raise and kick the campaign off in Flint." Mantha said. "So that hopefully people will see that the money they are donating is doing some good."

The first priority in the giveaway will be single mothers, Manth said. He then plans to contact the Concerned Pastors for Social Action to determine the residents who are most in need.

Mantha said the cost of one filter is roughly $40 and he is working with companies to purchase the filters. The NSF filters will remove lead from the water, he said.

As of Tuesday, Sept. 23, the campaign had already raised $985. One-hundred percent of the funds raised will be used to buy the NSF filters.

For more information on the GoFundMe campaign, click here.

Flint issues warning about lead in city's drinking water

By STEVE CARMODY • 6 MINUTES AGO

Michigan Radio

The advisory comes a day after local hospital officials announced blood lead levels in young children in Flint have doubled, and in some cases tripled, since the city started getting its drinking water from the Flint River in April of 2014.

Mayor Dayne Walling says city residents should take steps to reduce their lead exposure.

The city is recommending Flint water users:

- Flush cold water pipes by running the water for approximately five minutes before use.
- Use only water from the cold water tap for drinking, cooking and especially for making baby formula
- Install a water filter that is NSF-certified for lead removal

The mayor says the city is also taking steps to address the problem, and plans to reduce corrosion in the city's drinking water.

Walling says the goal is to make Flint "lead-free."

"So that whatever our water source and situation is … that we are providing a safe environment for all of Flint's families … especially our children," says Walling.

But it is the source of the city's drinking water that many critics say is the source of the problem.

Curt Guyette, with the ACLU, says city leaders' insistence that Flint's water is "clean and safe" while blaming lead pipes for the lead in the water is "double talk." Guyette says it's clear the corrosiveness of the Flint River is causing the lead pipes to break down.

"They are doing everything they can to try to not admit that," says Guyette.

City, Genesee County and state officials say they are reviewing data collected by researchers from Virginia Tech.

The Virginia Tech researchers tested water samples collected from nearly 300 Flint homes. Many of the homes tested above the 15 parts per billion threshold.

Similar testing by the city and overseen by the state showed lower lead levels.

Officials says it's that disagreement that's causing some delay in coming up with a response.

"You need concrete data. And I'm going to be quite honest, there's some conflicting data right now, in terms of the results that have been presented," says Mark Valacak is the health officer with the Genesee County Health Department.

"As we move forward, we'll have more data and be able to justify … additional resources coming in to the community," says Valacak.

Mayor Walling has asked the governor's office for $30 million to fix the system and help replace lead pipes.

The lead pipe problem is not confined to individual homes. City officials say 15,000 transmission lines connecting homes to city water mains are made with lead pipes. That's about half of the city's customers.

You can read an FAQ from the state about water lead levels here.

http://www.dispatchtimes.com/area-doctors-urge-seniors-children-pregnant-women-to-stop-drinking-flint/103934/

Area doctors urge seniors, children, pregnant women to stop drinking Flint

BY **NEWSMEDIA**ON **SEPTEMBER 25, 2015**

Dispatch Times

They have advised senior citizens, children, and pregnant women to stop drinking *Flint* water right now or they could face irreversible damage.

Walling said the water source, whether the city continues to get water from the Flint River or go back to getting its water from Detroit, will continue to be a discussion.

The advisory was issued after researchers released findings of an increase of blood lead levels in Flint children.

But until the new system comes on-line in 2016, Flint is temporarily pulling water from the Flint River. This causes the treated water to leach lead from pipes and soldering. “We are very concerned and we will take steps to contain lead levels in the water”.

They said the levels of lead in certain neighborhoods have more than doubled since the city tapped its own water supply. About 4 percent of the later samples revealed elevated levels. In Flint’s highest risk ZIP codes, the change was even more surprising, she said – jumping from 2.5% of the children to 6.3%. Blood is drawn as part of routine lead-level testing, especially among children who are on Medicaid or are in high-risk areas. Newborns can experience not only slowed development, but slowed growth.

Residents said they are exhausted of hearing about what's wrong with the water, they want to know when it's going to be safe for everyone.

A group of volunteer researchers from Virginia Tech University have been doing ongoing work on the safety of Flint drinking water.

The city of Flint has issued a lead advisory for its residents.

State regulators quickly decried the study, calling concerns about Flint's drinking water "near hysteria".

What is to be done about this problem remains to be seen.

The Genesee County Medical Society Board of Directors approved a resolution Tuesday, September 25, encouraging breast feeding, advising no use of Flint tap water by infants who are fed formula, and encouraging the city to end its use of the Flint River as a water source "as soon as is practicable". The mayor is asking the state for $10 million in funds to replace lead water service lines.

http://www.usnews.com/news/articles/2015/09/25/flint-michigan-children-show-high-levels-of-lead-in-blood

US News and World Report

Did This Michigan Town Poison Its Children?

Children in Flint, Michigan are showing high levels of blood lead.

Associated Press Sept. 25, 2015 | 8:46 a.m. EDT

- □□□□□□□□

- □□□□□□□□

FLINT, Mich. (AP) — Some doctors urged Flint on Thursday to stop using the Flint River for water after finding high levels of lead in the blood of children, an extraordinary health warning in an ongoing controversy over the city's water supply.

"It's our professional obligation to care for the children of Flint if we know something," said the lead researcher, Dr. Mona Hanna-Attisha of Hurley Medical Center in Flint. "Lead poisoning is irreversible. This is not what our community needs. You have to err on the side of caution (and) educate the public."

There is no dispute that water drawn from the Flint River since 2014 is agitating and releasing lead in old pipes and service lines in thousands of homes. State regulators insist the water is safe, although they're urging anyone with concerns to have their water tested for free.

Hanna-Attisha said she looked at 1,746 test results from Flint children this year, compared to earlier results when Flint used Lake Huron as its water source. The percentage of kids with above-average lead levels had nearly doubled, according to the study. In certain areas, it tripled.

The study said Flint should stop using the Flint River "as soon as possible." Flint plans to switch to Lake Huron water again in 2016 when a pipeline is completed.

"No amount of lead is good for human beings. ... You can pay now or pay later," said Dr. Lawrence Reynolds, president and chief executive officer of Mott Children's Health Center, who appeared at a news conference with Hanna-Attisha.

State regulators quickly responded. Brad Wurfel, spokesman at the Department of Environmental Quality, said the water controversy is becoming "near-hysteria."

"I wouldn't call them irresponsible. I would call them unfortunate," Wurfel said of the doctors' comments.

"Flint's drinking water is safe in that it's meeting state and federal standards," he said. "The system has an aging portion that needs to be addressed. They haven't had meaningful maintenance for four decades or more."

The state Department of Health and Human Services hasn't found the same results in its own work, spokeswoman Geralyn Lasher said.

"Our experts want a better sense of how they got there," she said. "The data that we have is a much larger set of data. ... We're not seeing what those numbers look like."

Lead contamination in water like 'living in a third-world country'

Posted: Sep 24, 2015 11:39 PM CDTUpdated: Sep 24, 2015 11:39 PM CDT

Posted By Lauren Chapman

By Gino Vicci, WNEM TV5 Reporter

Fox Carolina

FLINT, MI (WNEM) -

The lead in a city water supply is at levels so high, it's being called a crisis.

"It kind of makes me feel like I'm living in a third world country," said Flint resident Maggie Kagen.

People in Flint have complained about the taste of their water since the city stopped buying it from Detroit and tapped the Flint River instead.

"Medically... this is unacceptable," said Dr. Mona Hanna-Attisha, Hurley Medical Center.

To say the city of Flint has problems with its drinking water, according to residents, would be an understatement.

"It's getting ridiculous... I'm paying for something I can't use," Kagen said.

Kagen is a single mother of five who feels the state of Flint's water supply is a health crisis. And now a doctor from Hurley Medical Center is demanding it be addressed immediately.

"It's something that's needed to be said.. it's nothing new," Hanna-Attisha said.

What is new is the presence of lead in the city's drinking water.

"Because this is something that is preventable, and this is something that is causing lifelong problems," Hanna-Attisha said.

At a news conference on Thursday at Hurley Medical Center, doctors, the Genesee County Health Department and experts urged expectant mothers and new mothers of infants to not drink unfiltered tap water or use it to mix baby formula.

They said the levels of lead in certain neighborhoods have more than doubled since the city tapped its own water supply.

Residents said they are tired of hearing about what's wrong with the water, they want to know when it's going to be safe for everyone.

"You can keep saying it's a problem, it's a problem, but if you don't come up with a solution, it doesn't make sense," said Cynthia Howell, a community advocate.

Howell is one of those residents who says enough is enough – it's time for a solution. One proposed solution at Thursday's news conference: switch the water supply back to Detroit.

Flint Mayor Dayne Walling said switching the water supply still doesn't address the city's aging infrastructure.

"We have to work long term get those lines replaced and eliminate this threat to childhood lead poisoning," Walling said.

Residents said they don't want to ignore the long-term needs of the city, but they wonder if there will be any relief in the short term.

Flint officials issue lead advisory

Herald Current

SEPTEMBER 25, 2015 BY ROSALIND GILMORE IN HEALTH

This causes the treated water to leach lead from pipes and soldering. "It has too much salt in it, and there was no plan to control the corrosion when the city began using the river in April 2014 ″ . Until the latest review, state data show that the percent of children with elevated blood lead levels have been falling for years.

The action comes in the same week that several health groups and physicians urged families not to use Flint tap water for infant formula because of rising levels of lead and a Hurley Medical Center doctor released a study showing increasing incidents of elevated blood lead levels in *Flint* children. "We are very concerned and we will take steps to contain lead levels in the water".

It opted instead to pull from the Karegnondi Water Authority, which is building a system to supply Genesee County with water pulled from Lake Huron.

The consequences of increased lead exposure, especially for younger children, can be dire. Areas that yielded the highest blood levels had an increase in abnormal samples from 2.5 percent to 6.3 percent. Symptoms can include developmental delays, irritability and sluggishness, as well as gastrointestinal problems like poor appetite, abdominal pain, and vomiting.

Residents said they are exhausted of hearing about what's wrong with the water, they want to know when it's going to be safe for everyone.

Water service lines installed before 1986 are more prone to lead issue due to the materials used in homes during that time, the city said in a press release.

A group of volunteer researchers from Virginia Tech University have been doing ongoing work on the safety of Flint drinking water.

Walling said earlier this week that city officials have been developing an advisory about lead dangers.

What is to be done about this problem remains to be seen.

Walling requested $30 million in funding from the state for water infrastructure assistance.

The city administrator, Natasha Henderson, said city officials are working with the Department of Environmental Quality to get corrosion control in place in Flint's water system.

Kids In Michigan May Be Drinking Water That's Tainted With Lead (Think Progress)

BY SAM P.K. COLLINS SEP 25, 2015 10:59AM

When Flint, Michigan officials changed the source of drinking water from Lake Huron to Lake Flint last spring, they assured residents that safety wouldn't be a concern, even as stories about changes in color, smell of chemicals, and sicknesses circulated through the state and national media outlets.

New research, however, has confirmed the worst, linking the switch in drinking water to a significant increase in the levels of lead found in children's bloodstream. The study, conducted by Dr. Mona Hanna-Attisha of the Pediatric Residency Program Hurley Medical Center, found elevated lead blood levels — surpassing 5 micrograms per deciliter — in 4 percent of Flint youngsters, which is 2 percentage points higher than what they recorded last year.

Researchers drew blood samples from more than 1,700 children five years of age and younger and analyzed two groups of samples: those taken before and after the switch. They also collected data from children living in the neighboring Genesee County, which still gets its water from the Detroit water system. Those test results found no changes in lead/blood levels among children living in the Genesee area.

Representatives of the Greater Flint Health Coalition, a group dedicated to improving the quality of the community health care system, released a statement calling on local lawmakers to issue an official warning to residents about the dangers of the drinking water.

"The findings released today are alarming. Our top priority has to be doing everything we can and finding every available resource to ensure access to safe water for Flint residents," Michigan State Senate Minority Leader Jim Ananich (D-Flint) said in a statement. "I will be leading an effort to raise state, private and philanthropic resources to deliver filters and clean water into the community as quickly as possible. We must act with urgency to protect Flint residents, especially those most vulnerable to the negative health impacts of lead: children," Ananich, also chair of the Greater Flint Health Coalition, added.

State regulators quickly decried the study, calling concerns about Flint's drinking water "near hysteria." Though Brad Wurfel, spokesperson at the Department of Environmental Quality, told U.S. News the drinking water met state and federal standards, he acknowledged that the aging water pipes haven't been maintained in more than 40 years.

The recent findings build on research previously conducted by scientists at Virginia Tech (VT) in August during which they collected and analyzed lead levels in 300 Flint homes. The researchers said the water in that area was five times more corrosive than other liquid sources in surrounding areas. VT Civil and environmental engineering professor Marc Edwards cited the study at a press conference earlier this month where he warned Flint residents that the water posed a significant danger to public health, unless it's properly filtered.

"This [problem with lead] is occurring because the water is too corrosive," Edwards said. "It has too much salt in it, and there was no plan to control the corrosion when the city began using the river in April 2014. Flint is the only city in American that I'm aware of that does not have a corrosion-control plan in place to stop this kind of problem."

Once lead enters the bloodstream via inhalation of dust, ingestion of food, drinking of water that flows through lead pipes, or hand to mouth activity, it travels to the nerves, kidneys, brain, muscles, and heart. In children and adults, the lead can be stored in the bones and teeth for decades before flowing into the bloodstream again and further damaging organs.

Long-term exposure to lead can cause blood anemia, colic, kidney damage, muscle weakness, brain damage, and death. Left unabated, lead in the bloodstream also affects reaction time, memory, and retention of new information. Hanna-Atisha's report said evidence supported the likelihood of decreased IQ among youngsters with lead/blood levels as low as 4 micrograms per deciliter.

The media shed light on the perils of lead exposure earlier this year in the days after Freddie Gray died under mysterious circumstances while in police custody. In 2008, Gray's family filed a lawsuit against Stanley Rochkind, the owner of a home they rented for four years, arguing that the children's exposure to the substance played a significant part in their educational, behavioral and medical problems — including attention-deficit hyperactivity disorder. The residence in question didn't undergo renovations when Baltimore City officials banned the use of lead-based paint in the 1970s.

On Friday, Hanna-Attisha made an appeal to Michigan lawmakers to prevent similar folly, pointing to the long-term public health effects of lead exposure. She said the issue could no longer be ignored. "It's our professional obligation to care for the children of Flint if we know something," Hanna-Attisha told the Associated Press. "Lead poisoning is irreversible. This is not what our community needs. You have to err on the side of caution [and] educate the public."

Area doctors urge seniors, children, pregnant women to stop drinking Flint water now

BY NICKY ZIZAZA THURSDAY, SEPTEMBER 24TH 2015

FLINT — Today at Hurley Medical Center, doctors warned the public that lead levels in Flint water are too high and many residents should stop drinking it immediately.

Hurley did their own study of Flint water. They have advised senior citizens, children, and pregnant women to stop drinking Flint water right now or they could face irreversible damage. This damage could include memory loss or lowered IQ.

They found double the acceptable amount of lead in Flint water. They tested the specific zip codes done in the recent Virginia Tech study and found excessive blood lead levels in children and babies.

This will affect them not only now, but for decades to come, doctors say. They are advising people to use lead filters.

The head of the Genesee County Health Department, Mark Valacak, said that just looking at children won't identify any of the issues. A blood test is the only way to know for certain.

Dr. Mona Hanna-Attisha, who ran the study, says, "This is not what our community needs."

The Virginia Tech study showed that Flint River water was specifically causing lead in old pipes to be released.

A gofundme account was recently set up by the Virginia Tech group, with the intent of buying the citizens of Flint filters that can remove the lead from the water.

Congressman Dan Kildee issued the following statement:

"Immediate action needs to be taken by the State of Michigan to ensure that relief is provided to people who are concerned about lead levels in their water. Today as part of my ongoing efforts, I talked with the EPA Region 5 Administrator about the State of Michigan providing emergency assistance, including lead-clearing filters and bottled water, until a more permanent solution can be determined.

"This new study by the medical community also raises additional doubts about prior water testing done by the DEQ and EPA that stated the water was in compliance with federal law. I have been completely unsatisfied with their answers to my questions regarding their testing methodology, which is why I have called for additional immediate independent and scientific testing to be done."

Senate Minority Leader Jim Ananich issued the following statement:

"The findings released today are alarming. Our top priority has to be doing everything we can and finding every available resource to ensure access to safe water for Flint residents. I will be leading an effort to raise state, private and philanthropic resources to deliver filters and clean water into the community as quickly as possible.

We must act with urgency to protect Flint residents, especially those most vulnerable to the negative health impacts of lead: children. Anyone with concerns about their water should visit flintwaterinfo.com and contact their physician or the Genesee County Health Department immediately."

Did Flint, Michigan, Just Lead Poison Its Children? Doctors Think So.

By: Russell Saunders 09.24.156:10 PM ET

Since the city switched from Lake Huron to the Flint River as a water source, its children's lead levels have doubled.

According to researchers in Flint, Michigan, blood tests have revealed a distressing conclusion—the tap water residents are drinking is causing elevated lead levels in the city's children.

A new study headed by Dr. Mona Hanna-Attisha, a researcher and director of the pediatric residency program at Hurley Medical Center, compared blood tests taken over a span of months in 2013 with samples taken over a similar span this year. During the time between, the city of Flint changed the source of its drinking water from Lake Huron to treated water from the Flint River.

What they found by comparing the samples is that the percentage of children with lead levels over the acceptable limit nearly doubled after the change. In 2013, about 2 percent of tests had results over 5 micrograms per deciliter (the current "safe" cut-off level, above which steps to identify and mitigate the source of lead exposure are recommended). About 4 percent of the later samples revealed elevated levels. Areas that yielded the highest blood levels had an increase in abnormal samples from 2.5 percent to 6.3 percent.

The consequences of increased lead exposure, especially for younger children, can be dire. Symptoms can include developmental delays, irritability and sluggishness, as well as gastrointestinal problems like poor appetite, abdominal pain, and vomiting. Newborns can experience not only slowed development, but slowed growth.

The new study recommends that Flint city water not be used to mix infant formula, or consumed by pregnant women.

The reason the new water source may be contributing to these elevated lead levels does not have to do with the lead content of the river water itself, but rather its effects on the lead pipes that approximately 15,000 homes in the city are reported to have.

A group of volunteer researchers from Virginia Tech University have been doing ongoing work on the safety of Flint drinking water. Their lead investigator, 2007 MacArthur fellow Dr. Marc Edwards, has noted that treated Flint River water is 19 times as corrosive as water from Lake Huron. This causes the treated water to leach lead from pipes and soldering.

In a separate report, the Virginia Tech team analyzed Flint city water directly and found that 42 percent of the 120 samples collected had lead levels greater than 5 parts per billion, and 20 percent had levels about 15 ppd, the cut-off at which the Environmental Protection Agency requires action.

What is to be done about this problem remains to be seen. Dr. Hanna-Attisha has said that city officials told her a return to Lake Huron water is not financially feasible for Flint. The mayor is asking the state for $10 million in funds to replace lead water service lines.

City must abandon Flint River as drinking water source amid lead crisis

The following is an opinion of The Flint Journal Editorial Board.

It's time to abandon the Flint River and go back to Lake Huron for Flint's drinking water.

And it's up to Gov. Rick Snyder to do it.

Flint residents were told they wouldn't notice any difference when officials made the switch April 25, 2014, after nearly 50 years of getting water from the Detroit pipeline.

"The water quality speaks for itself," Flint Mayor Dayne Walling said the day of the switch.

Today, that quality is still speaking and it's sounding worse by the day.

A switch that was made to save the cash-strapped city money has turned into a dangerous waiting game while crews build a new pipeline to Lake Huron.

But with the new pipeline still a year away from completion, Flint residents can no longer be asked to drink water that's safety cannot be guaranteed.

Elevated levels of the chemical TTHM in the water have segued into reports of elevated lead in the water. More Flint infants and children are being found with elevated levels of lead in their blood since the city switched to using the Flint River as its water source, according to a study from a Hurley Children's Hospital doctor.

While scientists debate test results, residents in one of the poorest cities in America are forced to either buy bottled water or take their chances with a system they're no longer confident is even safe.

This switch was made while Flint was under control of a state-appointed emergency manager, and we call upon the governor to make this right for Flint citizens by brokering a return to Detroit water that won't bankrupt the city of Flint.

Flint is in a crisis that was created in no small part by Snyder's hand-picked emergency manager and it is Snyder's job to fix this mess.

Officials have said that returning to Detroit water for the short term is not fiscally sound but that is not enough to justify staying with Flint River water. Flint is in the midst of a full-blown water emergency right now and it is incomprehensible that a solution cannot be found with our fellow Michiganders to deliver healthy water.

There is a lake full of healthy drinking water just an hour away and the pipes already in place to bring it here.

Clean water can be ours again.

Make the switch — now — before it's too late.

Elevated lead found in more Flint kids after water switch, study finds

By Ron Fonger | rfonger1@mlive.com
The Flint Journal on September 24, 2015 at 2:09 PM, updated September 24, 2015 at 4:31 PM

FLINT, MI -- More Flint infants and children are being found with elevated levels of lead in their blood since the city switched to using the Flint River as its water source, according to a new study by a Hurley Medical Center doctor.

The data show that the percentage of Flint infants and children with above average lead levels has nearly doubled citywide, and has nearly tripled among children in "high risk" areas of lead exposure, according to the study.

The research was based on blood samples from more than 1,700 children living in the city, and underscores Flint's struggles with water quality since switching from Lake Huron water in April 2014. Results of the study were delivered to Flint Mayor Dayne Walling and City Administrator Natasha Henderson this week.

The study includes a recommendation that the city end its use of the Flint River as its drinking water source "as soon as possible."

Among its key findings and recommendations:

- The percentage of children 5 years old and younger with more than 5 micrograms per deciliter of lead in their blood increased from 2.1 percent while Flint purchased Lake Huron water from the city of Detroit to 4 percent after the switch to the Flint River.

- The report also recommends that infant formula not be mixed with Flint tap water, that pregnant mothers not use city water, and that lead-clearing filters be distributed here.

- Areas of Flint with the highest lead levels, according to testing by Virginia Tech University, also showed the most drastic increases in elevated lead levels in children, rising from 2.5 percent to 6.3 percent.

- The study recommends the city declare a health advisory that could trigger additional resources from the federal government.

Findings from the study are expected to be discussed at a news conference scheduled for 3 p.m. today, Sept. 24, at Hurley.

In addition to lead researcher Dr. Mona Hanna-Attisha, representatives of the Greater Flint Health Coalition, Mott Children's Health Center, Hamilton Community Health Network and Genesee County Medical Society are also expected to speak about their concerns about the safety of Flint water.

The data from Flint children reveals an alarming increase in lead poisoning, said Hanna-Attisha, director of Hurley's pediatric residency program and an assistant professor in the Department of Pediatrics & Human Development at Michigan State University's College of Human Medicine.

The study used a database, built from blood tests collected from about 150 doctors and health care providers. It compares the lead levels in the blood of children from Jan. 1, 2013, until Sept. 15, 2013, to levels in samples collected from Jan. 1, 2015, until Sept.

15, 2015.

The city began using the Flint River as its drinking water source in April 2014, and testing by both the city and Virginia Tech have shown that lead is increasingly leaching into the city's water system.

City and state officials have said their own testing inside 169 homes in the city since the switch to river water have registered lead levels below the federal threshold of 15 parts per billion of lead.

Treated river water is 19 times more corrosive than Lake Huron water, according to Professor Marc Edwards of Virginia Tech, causing lead and lead solder in water transmission pipes and home plumbing to seep into the water supply.

Although there are measures that can be taken to reduce corrosiveness in water, including the use of phosphates, Flint had no such plan in place.

"This (higher blood lead levels in children) is exactly what you would expect to see when you put highly corrosive water into a city with so much lead plumbing and pipes," Edwards said today.

"If you look at the level of lead in Flint water, (the study is) perfectly consistent with (my) expectations."

Walling announced earlier this month that the city would speed up efforts to develop a corrosion control plan by the end of the year and has asked Gov. Rick Snyder for $10 million to replace water service lines with lead or lead solder in them.

City and state officials have estimated 15,000 homes in Flint have service lines made with lead.

The Flint Journal-MLive could not reach Walling or Henderson for comment on the new study this morning.

On Wednesday, Sept. 23, the mayor said he would issue an advisory and promote ways to minimize residents' exposure to lead such as flushing pipes before drinking city water.

Hanna-Attisha and Dr. Lawrence Reynolds, president and chief executive officer of Mott Children's Health Center, said they met Walling, Henderson and Department of Public Works Director Howard Croft Monday, Sept. 21, and were told that a return to purchasing water from Detroit would bankrupt the city.

The doctors said they are issuing their recommendations, including an end to use of the Flint River as a water source, because the city has so far failed to act.

"It's our professional obligation to care for the children of Flint (and to tell parents) if we know something," Hanna-Attisha said. "Lead poisoning is irreversible. This is not what our community needs. You have to err on the side of caution (and) educate the public."

State Senate Minority Leader Jim Ananich, D-Flint, issued a statement today, calling the findings of the lead study "alarming."

"Our top priority has to be doing everything we can and finding every available resource to ensure access to safe water for Flint residents," Ananich's statement says. "I will be leading an effort to raise state, private and philanthropic resources to deliver filters and clean water into the community as quickly as possible."

Blood lead levels above 5 micrograms per deciliter are considered elevated by the Center for Disease Control and Prevention and the new study says increasing evidence shows no safe blood lead level.

Lead is a toxic metal that was used for many years in products found in and around homes and may cause health effects such as behavioral problems and learning disabilities, according to the U.S. Environmental Protection Agency.

Reynolds said today in addition to the cost of reconnecting Flint to Detroit water, city and state officials must consider the cost of distributing water with higher lead levels than necessary, including the potential for additional attention deficit hyperactivity disorder, lower IQs, and delinquent behavior.

"No amount of lead is good for human beings," he said. "We cannot predict which child will be affected by high lead levels (and) we have a ... risk we can prevent ...

"you can pay now or pay later," he said.

The city began using the Flint River as a water source for the first time in more than 50 years in April 2014 -- a decision made by state-appointed emergency manager Darnell Earley.

Former emergency manager Jerry Ambrose, who replaced Earley, has said returning Flint to the Detroit-supplied Lake Huron water would be cost-prohibitive, resulting in an increase of about 30 percent in water rates.

Walling has also opposed a short-term contract to buy water from Detroit.

Doctors to speak out today on lead in Flint water

By Ron Fonger | rfonger1@mlive.com

The Flint Journal on September 24, 2015 at 12:40 PM, updated September 24, 2015 at 3:24 PM

FLINT, MI -- Representatives of several Flint medical institutions, including Hurley Medical Center and Mott Children's Health Center, say they will discuss their concerns regarding lead levels in the city's drinking water at a news conference today, Sept. 24.

Hurley said in a news release that it will host the groups at the 3 p.m. news conference and that the meeting will also include representatives of the Flint Health Coalition, Hamilton Community Health Network and Genesee County Medical Society.

The news conference comes one day after Mayor Dayne Walling told The Flint Journal-MLive that the city would issue a lead advisory in the wake of the Greater Flint Health Coalition urgently asking the city to take that step.

The Journal could not reach Walling or City Administrator Natasha Henderson for comment today.

Walling and other city officials met with representatives of the coalition this week, hearing their concerns about the safety of Flint water.

The coalition issued a statement saying "not enough was being done to alert the public to potential risks of consuming Flint city water that could lead to elevated levels of lead."

Researchers from Virginia Tech University reported this month that their testing of Flint water in homes shows a far-reaching problem with lead.

Ten percent of Flint homes tested by Virginia Tech had 25 parts per billion of lead or more, far more than the allowable level -- 15 ppb -- set in federal guidelines, according to the university researchers.

City and state officials have said their testing shows Flint's water supply meets all health and safety regulations, never rising above 11 ppb in more than 10 percent of homes during the last 16 months.

Data from the state Department of Environment Quality shows lead levels have spiked since the city began using the Flint River as its water source in April 2014 but remained within federal thresholds for lead.

---

Flint to issue lead in water warning after push from doctors, health officials

By Ron Fonger | rfonger1@mlive.com

The Flint Journal on September 24, 2015 at 5:50 AM, updated September 24, 2015 at 9:59 AM

FLINT, MI -- The city of Flint is expected to advise its water customers on ways to minimize exposure to lead in its tap water -- particularly for children -- after a group that includes doctors and health officials strongly suggested the step.

Flint Mayor Dayne Walling confirmed the move on Wednesday, Sept. 23, after The Flint Journal-MLive learned the Greater Flint Health Coalition approved a resolution two days prior urgently asking the city to issue the advisory.

Representatives of the coalition met privately with Walling and other city officials to express their concerns about the safety of Flint water, and issued a statement saying "not enough was being done to alert the public to potential risks of consuming Flint city water that could lead to elevated levels of lead."

Walling's statement said the city "will be issuing an advisory" on the matter "in cooperation with health partners promoting ways to minimize the exposure to lead such as flushing pipes when the water has been sitting." He did not specify when the advisory would be issued.

Walling, who earlier this month asked Gov. Rick Snyder for $30 million for Flint's infrastructure, including $10 million to replace lead service lines to homes, said in an email that he "will continue to pursue funding for a comprehensive healthy homes initiative that addresses lead in paint and pipes."

"We have to get the lead out of our community to eliminate the threat of childhood lead poisoning," the statement says. "I am extremely concerned to hear from doctors about any elevated blood lead levels in Flint's children."

The Journal could not immediately reach Walling for more information on the concerns expressed to him by doctors about lead.

Kirk D. Smith, president and chief executive officer of the Greater Flint Health Coalition, and state Senate Minority Leader Jim Ananich, the chairman of the group's board of directors, issued a statement to The Journal about the coalition's recommendation on issuing precautions.

"As a coalition of concerned physicians, health care professionals and county leaders, we are compelled to inform the public when there is a possible threat to their health so they can take appropriate precautions and actions to protect themselves and their families," the joint statement says.

"At our last meeting and in recent days we have heard from numerous physicians who shared strong concerns that not enough was being done to alert the public to potential risks of consuming Flint city water that could lead to elevated levels of lead."

A resolution approved by the nonprofit coalition's board of directors, which includes representatives of Flint area hospitals, universities, physicians and unions, comes after researchers from Virginia Tech University reported their testing here shows a far-reaching problem with lead in water.

Ten percent of Flint homes tested by Virginia Tech had 25 parts per billion of lead or more, far more than the allowable level -- 15 ppb -- set in federal guidelines, according to the university researchers.

City and state officials have said their testing shows Flint's water supply meets all health and safety regulations, never rising above 11 ppb in more than 10 percent of homes during the last 16 months, but data from the state Department of Environment Quality shows lead levels have spiked since the city began using the Flint River as its water source in April 2014.

At the urging of state and federal officials, the city announced three weeks ago that it would speed up the development of plans aimed at making Flint water less corrosive.

Professor Marc Edwards of Virginia Tech has said treated river water is currently far more corrosive than water the city had used for decades -- Lake Huron water that was treated and piped here by the city of Detroit.

Edwards has criticized the city and the state for not having developed a plan for reducing the corrosiveness of Flint's water because an estimated 15,000 homes in the city have lead or lead solder in service lines and plumbing, making the homes much more susceptible to lead leaching into water.

City Councilman Scott Kincaid, also a member of the GFHC, said he supported the organization's request for further action -- particularly after physicians raised concerns about how high lead levels could affect infants and young children.

"I'm supporting the resolution. I think we need to advise people that there is a potential concern," Kincaid said. "Lead isn't good for anybody, but the effect on infants" is especially disturbing.

Although the city has yet to issue its lead advisory, Walling's mention of allowing water to flush through pipes is the same advice given by Virginia Tech earlier this month.

Researchers at the university have also recommended that infants not be fed formula made with unfiltered Flint tap water and that residents who are not flushing water for five minutes before using it for drinking or cooking should use a filter certified to remove lead.

The Journal could not reach Dr. Lawrence Reynolds, president and CEO of Mott Children's Health Center, for comment Wednesday. Other coalition members said Reynolds led the push for additional, quick action by the city.

Lead is a toxic metal that was used for many years in products found in and around homes, according to the U.S. Environmental Protection Agency. Even at low levels, lead may cause health effects such as behavioral problems and learning disabilities.

Current regulations for lead in water began in 1992 and require a limited amount of testing to measure the degree to which lead leaches into tap water after flowing through lead service lines and lead solder in home plumbing.

Flint has struggled with its water quality since switching to the Flint River as its primary water source in April 2014. Previously, the city had purchased water through the city of Detroit, which got its water from Lake Huron.

Flint was required to step up its testing of water in homes after it shifted to the Flint River, which is intended to be a temporary move as the city and Genesee County are partners in building a new water pipeline to Lake Huron through a partnership called the Karegnondi Water Authority.

The city has been using -- and Walling and state emergency managers have supported continuing to use -- the Flint River as a stopgap water source until the KWA pipeline is expected to be completed in 2016.

In state testing of city water samples, Flint has stayed below the federal threshold for lead, with less than 10 percent of tap water samples exceeding 15 ppb.

Water systems can be required to take steps like making water less corrosive or replacing lead service lines if sampling shows such elevated lead levels.

But after the Virginia Tech testing showed lead was much more prevalent than Flint's testing showed, Edwards and U.S. Rep. Dan Kildee each raised doubts about the water testing by the city and DEQ.

Kildee said in a news release Sept. 21 that "the city, DEQ and (U.S. Environmental Protection Agency) have not adequately answered my questions on their testing methods to ensure the safety of Flint's water."

GoFundMe page created by Virginia Tech researcher to buy filters for Flint residents

By Amanda Emery | aemery@mlive.com

The Flint Journal Follow on Twitter on September 23, 2015 at 5:00 AM, updated September 23, 2015 at 5:03 AM

FLINT, MI -- A Virginia Tech University researcher has started a GoFundMe campaign in an effort to purchase lead filters for Flint water customers in need.

Anurag Mantha, a graduate student at Virginia Tech, said he has been in charge of the Flint Water Study Group and the community outreach for the group. Mantha said his job has been to analyze water samples and call people with high levels of lead to tell them their water is unsafe to drink.

"So I have been calling people and they have been telling me that they couldn't afford to buy filters." Mantha said. "That's one of the options we give to the people who have high amounts of lead. We tell them to buy NSF (National Sanitation Foundation) certified filters and they said they couldn't afford to buy them because their water bills were so high already and it was just a financial burden on them."

Virginia Tech researchers have said their testing shows a serious problem with lead in Flint water including 10 percent of homes that had 25 parts per billion of lead or more -- far more than the allowable level -- 15 ppb -- set in federal guidelines.

Mantha said he approached Professor Marc Edwards, who is heading up the study in Flint, and said he wanted to start a GoFundMe campaign to purchase filters for Flint residents in need. He said the campaign's goal is set at $25,000, but he isn't waiting to hit the goal to start helping residents out.

"Once we get things finalized we'll use the first $1,000 that we raise and kick the campaign off in Flint." Mantha said. "So that hopefully people will see that the money they are donating is doing some good."

The first priority in the giveaway will be single mothers, Manth said. He then plans to contact the Concerned Pastors for Social Action to determine the residents who are most in need.

Mantha said the cost of one filter is roughly $40 and he is working with companies to purchase the filters. The NSF filters will remove lead from the water, he said.

As of Tuesday, Sept. 23, the campaign had already raised $985. One-hundred percent of the funds raised will be used to buy the NSF filters.

For more information on the GoFundMe campaign, click here.

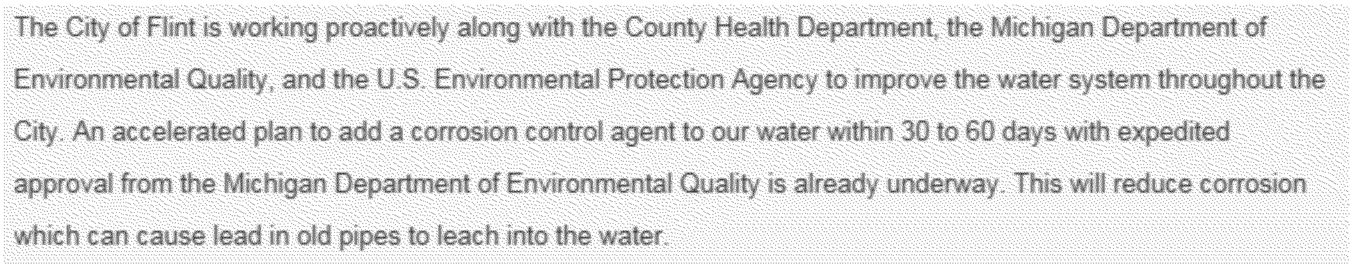
Subject: flint: link to city lead advisory (says corrosion control inhibitor to be added in 30-60days); genesee county health dept fact sheet (includes old lead-free definition)

Hi All,

Here's a link to the City's website with information on the Lead Advisory: https://www.cityofflint.com/2015/09/25/city-of-flint-issues-lead-advisory/

Part of the advisory includes a time frame of 30-60 days for when corrosion control inhibitor will be added:



The City of Flint is working proactively along with the County Health Department, the Michigan Department of Environmental Quality, and the U.S. Environmental Protection Agency to improve the water system throughout the City. An accelerated plan to add a corrosion control agent to our water within 30 to 60 days with expedited approval from the Michigan Department of Environmental Quality is already underway. This will reduce corrosion which can cause lead in old pipes to leach into the water.

The Genesee County fact sheet isn't as nicely laid out as the one from the Sen. Ananich's website, and it refers to the old lead-free standard for faucets: http://www.gchd.us/docs/Popular_Pages/GCHD_Lead_in_Water_Fact_Sheet__2_.pdf

What can I do to reduce or eliminate lead in my tap water?

Flush your cold-water pipes by running the water for approximately 5 minutes. The longer the water has been sitting in the pipes, the more lead it may contain. You can fill containers for later use, after the flushing process. Use only water from the cold-water tap for drinking, cooking, and especially for making baby formula. Hot water is likely to contain higher levels because it dissolves more lead.
You may choose to install a water filter that is NSF-certified for lead removal. If a water filter is installed replace filters at least as often as recommended by the manufacturer.

Buy a lead-free faucet. The legal definition of "lead-free" still allows brass faucets to contain up to 8 percent lead. However, faucets marked with "NSF 61/9" and/or "California Proposition 65" meet stricter limits. Regularly clean particles from faucet aerators.

Thanks,

Andrea Porter

Subject: Re: CONFIDENTIAL: DELIBERATIVE--DO NOT RELEASE

Thanks Stan -- this is an excellent summary and I agree with both of Tom's suggestions. Two additional points:

1. I don't think it's accurate to characterize Implementing corrosion control as a "possible" additional measure. The City and MDEQ have made clear that this is going to occur asap -- it will just take a while to work. The real focus now is on finding money to pay for interim measures to protect vulnerable populations.

2. Flint River water isn't necessarily more corrosive than Lake Huron water -- it's just that the Lake Huron water that the City used to receive from Detroit had been treated with orthophosphate. Flint needs to add orthophosphate to the Flint River water being used now and will need to add orthophosphate to Lake Huron water when they switch over.

BTW. I have reached out to Dan Wyant -- but have not yet heard back from him.

>> According to press reports, the Mayor of Flint, Michigan, Dayne Walling, has stated publicly that the city's use of the Flint River as a drinking water source has resulted in an increased risk of lead leaching into drinking water because of the corrosiveness in the water supply coming from the Flint River. An advisory commission to the mayor of health professionals has also urged that additional actions need to be taken quickly. Outside parties, including a professor at Virginia Tech who has been involved in other city drinking water cases, including Washington, DC, have expressed concern that the increased corrosiveness of the Flint River source water is increasing the potential for higher levels of lead in blood for infants and small children, and has publicly released a study that makes this claim based on sampling for water and children's blood lead levels in Flint.
>>
>> There seems to be general agreement that there is a need for additional measures to control lead levels in the Flint, Michigan water system and to address public health concerns, but the question of their cost and how these will be paid for remains unsettled.
>>
>> The Mayor has asked for technical assistance from EPA and has talked with both leadership in Region 5 and the Office of Water, and we have offered technical assistance from ORD. The Mayor has requested additional funding assistance from Governor Snyder but as yet there has been no response from the State to this request. Congressman Dan Kildee has written EPA, FEMA and CDC/HHS also asking about funding assistance. Neither FEMA nor CDC/HHS has such funds available.
>>
>> Background
>>
>> Flint, Michigan is a city with a current population of about 99,000. In April, 2014 Flint switched its source drinking water supply from water supplied by the city of Detroit (from Lake Huron) to water from the Flint River. This was a measure to save money (about $1.5 million a month) until Flint could complete its own pipeline to Lake Huron, a project expected to be completed by the end of 2016. At the time the switch was made, Flint was effectively in receivership and the switch was part of cost saving measures imposed by the city's receiver, appointed by the Governor. (Note: the city exited receivership earlier this year but is still in severe financial straits).
>>
>> At the time the switch was made, it was understood by the city and the state that because the corrosivity of Flint River water was greater than Lake Huron, and because there are lead pipes and fixtures and lead solder for copper pipes in the distribution system and households in Flint, there was a risk of increased mobilization of lead in home water supplies. The state directed the city to monitor the levels of lead in household systems following the switch to determine what additional corrosion controls might be needed.
>>
>> Since the switch there has been increasing concern that lead concentrations in Flint drinking water are in fact increasing, at least in some parts of the drinking water system. The populations of greatest concern are infants and small children in parts of Flint that have the highest amount of lead plumbing in the distribution system (this is not known with precision although there appears to be some data). Though the magnitude of the increasing concentrations, and how concentrations relate to existing health criteria, remain in dispute, there appears to be general agreement that additional mobilization of lead is occurring, and the city is now agreeing that additional measures are needed.
>>
>> The range of possible additional measures includes the following:
>>
>> -- The use of additional corrosion control techniques, specifically the addition of chemicals to reduce the corrosivity of the water and allow a biological film to grow back that will minimize mobilization of lead from pipes, fixtures and solder. Two notes on this are relevant: first, it will take time for the film to regrow, and second, the balancing of the water chemistry of chemical addition so that other detrimental effects do not occur, such as the creation of additional disinfection byproducts, will also take some time.

>>
>> -- In the short term, supplying bottled drinking water and/or formula to households which are at greatest immediate risk of lead exposures. Priorities would be households with infants/small children in parts of Flint with the greatest exposure risk. It is not clear how many households this would cover.
>>
>> -- Another possible short term measure would be the use of Point of Service filters to reduce lead concentrations in drinking water. Such filters would be most useful in reducing lead exposure from small lead particles dislodged in the distribution system, not from dissolved lead, but given the age of Flint's distribution system this could provide some benefit.
>>
>> -- The city is already advising households to run taps for 5 minutes before using water for drinking, as this reduces lead concentrations as compared to first use water.
>>
>> -- Finally, the option of reconnecting the city's system to Detroit during the period before completion of the Flint pipeline to Lake Huron has also surfaced. This would also take a period of time to be effective in reducing concentrations for the same reason as the use of corrosion control techniques.
>>
>> Considerations Moving Forward
>>
>> -- Drinking water systems are historically managed between State and local health/environment departments. In Michigan, MDEQ is the responsible SDWA state agency. It appears to this point that the State health department has not been heavily involved. Tom makes the point that in other states, the health department's assessment of the degree of public health risk is highly influential within the state.
>>
>> -- Mayor Walling is in a contentious reelection campaign.
>>
>> -- Marc Edwards, the Virginia Tech professor, has reached out to EPA staff in Region 5 and in Headquarters, criticizing Flint's sampling program and expressing his opinion that "This is an unprecedented situation and EPA needs to take this seriously. Now." And "I believe someone at HQ or Region 5 should immediately take decisive action on this issue to protect the public.
>>
>> -- Prospects for class action litigation are being explored in Flint.
>>
>> -- We are not certain what additional actions the State of Michigan is contemplating. Susan is reaching out this weekend to the Director of Michigan DEQ to gain additional insight on this point. There is a sense that the state knows they bear some responsibility because of the financial dynamics of the source water switch, but what this may specifically mean is unclear.
>>
>> -- We are exploring whether the Drinking Water State Revolving Loan Fund could support the acquisition of Point of Use filters. Cost of this is unclear, and any equipment would need monthly filter replacement. Early assessment is that this would be precedent setting, and it is not clear we have the legal authority under the Safe Drinking Water Act to do this.
>>
>> -- Issues with past mismanagement (in prior administrations) of Flint water utility revenues complicate these discussions.
>>

Subject: MDEQ request for technical assistance

I had a conversation with Dan Wyant today about the situation in Flint. We talked about the need for expedited implementation of corrosion control and making sure that appropriate testing protocols are used. He asked that EPA provide technical assistance to MDEQ to do this. Would you please arrange for the ORD people on the Flint Technical Advisory Committee to reach out to provide direct assistance to MDEQ, as well?

Also -- please work with Felicia to find a time at the end of the day tomorrow to check in on Flint.

Thanks.

Subject: Re: flint: link to city lead advisory (says corrosion control inhibitor to be added in 30-60days); genesee county health dept fact sheet (includes old lead-free definition)

Expedited CCT!?

This is how the problem started in the first place - a light-speed rush to get off the Detroit system before they could actually gear up to learn how to run a river source. If that timeline is accurate, it seems their objective is not to fix the problem, but to stop the criticism.

My fear here is that they keep saying they are working with EPA when I know they have not had one technical advisory meeting that includes Mike/Darren yet. To the contrary, from the city's email, they scheduled a meeting without consulting EPA and Mike cannot even be there (non-negotiable date/time).

Mike can correct me if I'm wrong, but I am unaware of any other technical meetings between ORD, Flint and MDEQ. This Flint/DEQ decision (if true) is being pushed out as if EPA is part of this process when I don't think we have even been provided any data to look at.

Subject: flint: link to city lead advisory (says corrosion control inhibitor to be added in 30-60days); genesee county health dept fact sheet (includes old lead-free definition)

Hi All,

Here’s a link to the City’s website with information on the Lead Advisory:
https://www.cityofflint.com/2015/09/25/city-of-flint-issues-lead-advisory/

Part of the advisory includes a time frame of 30-60 days for when corrosion control inhibitor will be added:

> The City of Flint is working proactively along with the County Health Department, the Michigan Department of Environmental Quality, and the U.S. Environmental Protection Agency to improve the water system throughout the City. An accelerated plan to add a corrosion control agent to our water within 30 to 60 days with expedited approval from the Michigan Department of Environmental Quality is already underway. This will reduce corrosion which can cause lead in old pipes to leach into the water.

The Genesee County fact sheet isn’t as nicely laid out as the one from the Sen. Ananich’s website, and it refers to the old lead-free standard for faucets:
http://www.gchd.us/docs/Popular_Pages/GCHD_Lead_in_Water_Fact_Sheet__2_.pdf

What can I do to reduce or eliminate lead in my tap water?

Flush your cold-water pipes by running the water for approximately 5 minutes. The longer the water has been sitting in the pipes, the more lead it may contain. You can fill containers for later use, after the flushing process. Use only water from the cold-water tap for drinking, cooking, and especially for making baby formula. Hot water is likely to contain higher levels because it dissolves more lead.
You may choose to install a water filter that is NSF-certified for lead removal. If a water filter is installed replace filters at least as often as recommended by the manufacturer.

Buy a lead-free faucet. The legal definition of "lead-free" still allows brass faucets to contain up to 8 percent lead. However, faucets marked with "NSF 61/9" and/or "California Proposition 65" meet stricter limits. Regularly clean particles from faucet aerators.

Thanks,

Andrea Porter

Flint River switch has increased risk of lead in water, mayor says

FLINT, MI -- Mayor Dayne Walling pushed the ceremonial button to change the city's water source from Detroit to the Flint River in April 2014.

Today, Sept. 25, Walling said he believes the city's use of the river has resulted in an increased risk of **lead leaching into drinking water** because of the river water's corrosiveness and said he would consider support for reconnecting Flint to the Detroit water system again.

Walling, **speaking at a news conference** to issue a lead advisory for the city, said he's willing to discuss buying Detroit-treated Lake Huron water again, but he said that decision rests with Gov. Rick Snyder.

His comments came the day after a Hurley Medical Center doctor released a study showing increasing incidents of elevated blood lead levels in Flint children.

Flint's long-term drinking water plan is still to eventually draw water from a new pipeline to Lake Huron that's being built by the city and Genesee County through the Karegnondi Water Authority.

But the pipeline isn't expected to be completed until sometime in 2016 and Flint has struggled with water quality and treatment since switching to the Flint River in the interim.

"I think that given the variety of information that's available that there is an increased risk (using the river), and that's why the city is issuing a lead advisory and encouraging every household to take these proactive steps," Walling said.

While the mayor left the door open to switching water sources -- at an estimated cost of $1.5 million per month, City Administrator Natasha Henderson and Brad Wurfel, a spokesman for the state Department of Environmental Quality, said Flint can't afford such a change.

The city's lead advisory includes recommendations from the Genesee County Health Department, suggesting residents flush cold water pipes by running water approximately five minutes before using; not using hot water for drinking, cooking or mixing infant formula; and installing water filters certified by the National Science Foundation for lead removal.

Although Walling said it would be technically possible to change the city's water source, Wurfel said it is not a realistic financially and unnecessary considering Flint's water meets the standards of the federal Safe Drinking Water Act.

Dave Murray, a spokesman for Snyder, did not directly address the issue of reconnecting to Detroit for water, but issued a statement saying, "The governor and state agencies continue to work with city and community leaders on a variety of approaches to help residents and ensure they have clean, safe water."

Asked if reconnection to the Detroit water system was still an option, Murray said, "The governor and representatives from state agencies continue to work with city leaders on a variety of topics related to Flint and its infrastructure challenges."

"It's important that residents have access to accurate information, and know where they can get their homes tested and have access to medical tests that will ease their minds," Murray's statement says. "Both the Department of Environmental Quality and the Department of Health and Human Services are working closely with the city and evaluating data to assist the Flint leaders as they make decisions for their city moving forward."

Walling said discussions with the state about reconnecting Flint to the Detroit water system have been ongoing, occurring as recently as Monday, Sept. 21, and could continue.

"Are there discussions about Detroit? The answer is yes," said Walling, who said he doesn't expect to initiate further discussions.

Walling has been lobbying the governor instead for $30 million in infrastructure funding, $10 million of which would be dedicated to replacing lead service lines leading to individual homes.

Lead leaching has been identified in the city's testing of water inside homes since the switch to the Flint River.

Lead levels have remained within allowable thresholds during the last 16 months, but the city's own testing shows lead levels have been rising since the city began using the Flint River for water.

Water testing by Virginia Tech university has shown even higher lead levels and researchers there have blamed the corrosiveness of river water and the large amount of lead and lead solder in Flint pipes and plumbing for the resulting lead levels.

On Thursday, Set. 25, a Hurley Medical Center doctor released a study showing increasing incidents of elevated blood lead levels in Flint children.

A spokeswoman for the state Department of Department of Health and Human Services has questioned that study and said blood lead levels in Flint have remained fairly steady for children under 16 years old since the city switched from Lake Huron water to the river.

Walling said today that the governor "needs to work harder to identify (necessary) resources" to help Flint with water issues.

"The governor has a substantial responsibility here," he said.

Snyder appointed a succession of emergency managers to run Flint after declaring a financial emergency here in 2011.

One of them -- Darnell Earley -- made the decision to use the Flint River as the city's drinking water source rather negotiating a new contract to continue buying Lake Huron water from Detroit in the short-term.

Since the switch to the river, individuals and groups like the Concerned Pastors for Social Action have lobbied to end the use of the river because they consider lake water safer and of higher quality.

In January, as Flint struggled to cut total trihalomethanes (TTHM) in treated river water, Sue McCormick, director of the Detroit Water and Sewerage Department, said she was willing to talk about providing emergency water to Flint -- even without a long-term deal between the two cities.

Greg Eno, a spokesman for DWSD, said he could not immediately say whether that offer remains as Detroit transitions to becoming part of a regional water authority.

Requirement to Install and Maintain OCCT Revised Draft v2 09-28-2015 jk.docx

Miguel,

I made a few edits. I added a sentence after the large non-(b)(3) requirements noting that large (b)(3) systems with treatment in place are still required to operate and maintain corrosion control treatment.

I am not sure that the added text on page 6 is necessary as it seems like a separate issue that could be applied to all consecutive system monitoring agreements without any clear resolution. How would the limited sample subset from a satellite system demonstrate (or not demonstrate) that the system has achieved the goal of reducing lead to as close as possible to the MCLG of zero? I think the other language you added later about the consecutive system agreement only applying to the monitoring addresses the issue with Flint and Detroit (bottom of page 6 and top half of page 7).

I have attached the edited version. Hope that helps.

Jeff

Importance: High

Hi Jeff,

Attached is the revised memo. I left it marked-up so that folks can see the edits quickly.

I incorporated some revisions on (b)(3) along the lines of what I sent you in my email. I think it's important to stress that 141.29 only allows monitoring modifications, not treatment designations, so I added that as well. It will make no practical difference in MI since they have never met (b)(3) as a 'single system' but I don't want anything we write to be miscontrued as if they can also modify other non-monitoring rule requirements using 141.29.

I need to ship this out to the larger group for review asap, so I'd appreciate it if you could look this over quickly. There are not a lot of substanative changes.

Subject: RE: URGENT: PLS REVIEW

Miguel,

I made two edits. One to make the 141.(b)(3) optimization more consistent with the rule language and the second was to add a paragraph to the applicability of OCCT requirements to consecutive systems on the implications for systems that meet the 14181(b)(3) optimization. That did not seem to be covered in that section and when I looked up Detroit's most recent Water Quality Report, the 2014 report shows a 90th percentile for lead of 2.3 ppb, which means it might be considered or could qualify as a 141.81(b)(3) system. I don't know if the 2.3 ppb is based on Detroit plus all consecutive systems or just Detroit, but thought the memorandum should cover that possibility. I have attached the revised draft and the 2014 Detroit Water Quality Report. Let me know if you have questions.

Dear Mr. Busch,

I appreciate your response.

Would you be able to send me a copy of the modified consecutive system approach to lead and copper monitoring that EPA approved?

I am sorry I cannot route my question through the NDWAC or my WG. I am not a NDWAC member, and my WG disbanded when our final report was completed back in August. I apologize if I have caused any confusion. The questions I am posing come solely from me because I am in the process of writing a dissenting opinion about the NDWAC LCR WG recommendations that is due to EPA in a couple of weeks. One of the main reasons I am writing this opinion is because of concerns I have about the LCR's CCT requirement. Your experience with and implementation of the LCR in Flint is extremely helpful to me in deepening my understanding about the LCR's CCT requirement and will undoubtedly allow me to write a more informed discussion.

I thank you in advance for your help on this matter and your support of ongoing efforts to assess the LCR carefully and thoroughly.

Kindly,

Yanna Lambrinidou

Subject: RE: question about optimal WQP ranges for Flint's water

Dr. Lambrinidou,

I'm sorry for the delay in my response. As some of your questions relate more to statewide program implementation I have requested assistance with the response from staff within our central program office. However, these staff were attending and participating in an offsite (American Water Works Association Conference Michigan Section) conference last week.

Michigan has implemented an EPA approved modified consecutive system approach to lead and copper monitoring where a wholesale water supply sells water to other community water systems. In addition, while water quality parameter (WQP) monitoring occurs at both the water treatment plant and in the combined distribution system, a WQP range is only required to be established at the water treatment plant tap after the system has demonstrated optimized corrosion control treatment (OCCT).

Thus when the City of Flint was a customer of the Detroit Water and Sewerage Department (DWSD), the City of Flint participated in WQP monitoring of its distribution system, but ranges were established only for the OCCT at DWSD treatment plants. The attached letter from our Department established the minimum levels for pH and phosphate dosage in 2000.

As the City of Flint water treatment plant has not yet installed such treatment or been given the designation of OCCT these plant tap values have not been established.

However, the City of Flint WTP has continued to maintain the minimum pH value requirement previously established for DWSD

As noted in your Working Group Report to the NDWAC, "Corrosion Control Treatment (CCT) involves the addition of chemicals (e.g. orthophosphates or silicate) to create a barrier between the pipes and the drinking water, or to modify drinking water chemistry (such as pH and hardness) to inhibit the potential for corrosion."

Should you consider the Flint WTP softening process to be OCCT, then the City already continues to comply with the OCCT requirements as the City of Flint has never had 10% or more of compliance tap samples exceed the 15 ppb action level. Even prior to DWSD's established OCCT the City of Flint lead compliance monitoring has never exceeded the 15 ppb action level.

If you have additional questions we would appreciate having them routed through the NDWAC and your Working Group. Thanks.

Subject: Re: question about optimal WQP ranges for Flint's water

Dear Mr. Busch,

Thank you for your quick response. I appreciate the information at, I am sure, a very busy time for you and MDEQ.

Could you please help me understand the following?

When you say that all previous optimal water quality parameter ranges would have been established for the Detroit water utility (not for the City of Flint), do you mean that MDEQ never set optimal water quality parameter ranges *specifically* for Flint before Flint's switch to Flint River water?

It is my impression, please correct me if I'm wrong, that under the LCR, all large systems -- whether they are consecutive or not -- must have optimal water quality parameter ranges designated by states *specifically for them* (at the time when these systems are deemed to have optimized their treatment). Is there language in the LCR I am missing that allows a utility not to have optimal quality parameter ranges established specifically for it?

My second question is this: If the City of Flint had no optimal water quality parameter ranges established specifically for it in the past, how did it achieve LCR compliance? Isn't it the case that utility-specific optimal water quality parameter ranges (and maintenance of these ranges) are required for all large systems to avoid an LCR violation?

I would appreciate your assistance on this matter, as it will shed light on an issue that seems to be very important for EPA's assessment of and upcoming revisions to the LCR.

Kindly,

Dr. Lambrinidou,

All previous water quality parameter ranges would have been established for the City of Flint's wholesale finished water supplier, the Detroit Water and Sewerage Department, not the City of

Flint itself.

As the City of Flint has not yet established optimized corrosion control treatment, the MDEQ is not yet at the point of regulatory requirements where the range of water quality parameters would be set.

Sent: Mon 9/28/2015 7:48:53 PM
Subject: Inquiry from Michigan Radio re Flint drinking water

Susan,

Michigan Radio is asking:

Back in July the ACLU leaked an interim EPA report related to higher than allowable lead levels in the city of Flint. I was told then that because the report had not been finalized, the EPA could not comment on it beyond a written statement.

Curious if that report has been finalized? If not, do you have any idea when it might be? Obviously it's sort of a hot topic again and we've gotten a few inquiries. If it is, could I get a copy of it? Or would I need to FOIA?

The draft response below is based on input from Tom Poy and the previous approved desk statement:

EPA is working to finalize the field report. In the meantime, EPA and the Michigan Department of Environmental Quality are working closely with the city of Flint to ensure that residents are provided with safe drinking water. In response to EPA and MDEQ recommendations, Flint has decided to implement corrosion control treatment and will receive EPA technical assistance to help with that effort.

EPA advises everyone across the country to flush their pipes before drawing drinking water to reduce exposure to lead. The more time water has been sitting in your home's pipes, the more lead it may contain. Anytime the water in a particular faucet has not been used for six hours or longer, “flush” the cold-water pipes by running the water before drinking and remember to use only cold water for drinking, cooking, and preparing baby formula. Flushing times can vary based on the plumbing configuration in the home and whether the home has a lead service line.

Flint residents that are concerned about lead in their drinking water should contact the water utility and may request sampling. Additional information about lead in drinking water is available at: http://water.epa.gov/drink/contaminants/basicinformation/lead.cfm.

Subject: Re: question about optimal WQP ranges for Flint's water

Tom--interesting that Yanna brings up the modified consecutive system approach to LCR monitoring. Mike Kovach (Benzie's predecessor), chief of CWS section, was so sure that all the Detroit consecutive systems would be below the AL, and he and Jim Cleland thought that the number of samples required for the 2 initial rounds were ridiculously high. So, they came up with this modified approach to the 2 initial sets of 6-month sampling, where the consecutive systems would take a reduced number of Lead samples. (but of course, by decreasing the number of samples, they were increasing the risk of exceeding the AL.) If there 90th percentile exceeded the AL, then the consecutive system would have to sample at the regulatory level. Imagine Mike's surprise when many of the consecutive Detroit systems exceeded the AL, and had to take the regulatory level of samples. The systems for the most part, did not save much, if any, money on the monitoring. Mike was disappointed in the results and said this modified consecutive system approach wasted money and time for systems and the State.

So, my memory of the modified consecutive system approach to LCR monitoring in MI, is that this applied only to the initial 2 6-month sets of lead sampling, 23 years ago. My reading of Steve's email, is that it is still ongoing, so I'm puzzled by his statements.

Dear Mr. Busch,

I appreciate your response.

Would you be able to send me a copy of the modified consecutive system approach to lead and copper monitoring that EPA approved?

I am sorry I cannot route my question through the NDWAC or my WG. I am not a NDWAC member, and my WG disbanded when our final report was completed back in August. I apologize if I have caused any confusion. The questions I am posing come solely from me because I am in the process of writing a dissenting opinion about the NDWAC LCR WG recommendations that is due to EPA in a couple of weeks. One of the main reasons I am writing this opinion is because of concerns I have about the LCR's CCT requirement. Your experience with and implementation of the LCR in Flint is extremely helpful to me in deepening my understanding about the LCR's CCT requirement and will undoubtedly allow me to write a more informed discussion.

I thank you in advance for your help on this matter and your support of ongoing efforts to assess the LCR carefully and thoroughly.

Kindly,

Yanna Lambrinidou

Subject: RE: question about optimal WQP ranges for Flint's water

Dr. Lambrinidou,

I'm sorry for the delay in my response. As some of your questions relate more to statewide program implementation I have requested assistance with the response from staff within our central program office. However, these staff were attending and participating in an offsite (American Water Works Association Conference Michigan Section) conference last week.

Michigan has implemented an EPA approved modified consecutive system approach to lead and copper monitoring where a wholesale water supply sells water to other community water systems. In addition, while water quality parameter (WQP) monitoring occurs at both the water treatment plant and in the combined distribution system, a WQP range is only required to be established at the water treatment plant tap after the system has demonstrated optimized corrosion control treatment (OCCT).

Thus when the City of Flint was a customer of the Detroit Water and Sewerage Department (DWSD), the City of Flint participated in WQP monitoring of its distribution system, but ranges were established only for the OCCT at DWSD treatment plants. The attached letter from our Department established the minimum levels for pH and phosphate dosage in 2000.

As the City of Flint water treatment plant has not yet installed such treatment or been given the designation of OCCT these plant tap values have not been established.

However, the City of Flint WTP has continued to maintain the minimum pH value requirement previously established for DWSD

As noted in your Working Group Report to the NDWAC, "Corrosion Control Treatment (CCT) involves the addition of chemicals (e.g. orthophosphates or silicate) to create a barrier between the pipes and the drinking water, or to modify drinking water chemistry (such as pH and hardness) to inhibit the potential for corrosion."

Should you consider the Flint WTP softening process to be OCCT, then the City already continues to comply with the OCCT requirements as the City of Flint has never had 10% or more of compliance tap samples exceed the 15 ppb action level. Even prior to DWSD's established OCCT the City of Flint lead compliance monitoring has never exceeded the 15 ppb action level.

If you have additional questions we would appreciate having them routed through the NDWAC and your Working Group. Thanks.

Subject: Re: question about optimal WQP ranges for Flint's water

Dear Mr. Busch,

Thank you for your quick response. I appreciate the information at, I am sure, a very busy time for you and MDEQ.

Could you please help me understand the following?

When you say that all previous optimal water quality parameter ranges would have been established for the Detroit water utility (not for the City of Flint), do you mean that MDEQ never set optimal water quality parameter ranges *specifically* for Flint before Flint's switch to Flint River water?

It is my impression, please correct me if I'm wrong, that under the LCR, all large systems -- whether they are consecutive or not -- must have optimal water quality parameter ranges designated by states *specifically for them* (at the time when these systems are deemed to have optimized their treatment). Is there language in the LCR I am missing that allows a utility not to have optimal quality parameter ranges established specifically for it?

My second question is this: If the City of Flint had no optimal water quality parameter ranges established specifically for it in the past, how did it achieve LCR compliance? Isn't it the case that utility-specific optimal water quality parameter ranges (and maintenance of these ranges) are required for all large systems to avoid an LCR violation?

I would appreciate your assistance on this matter, as it will shed light on an issue that seems to be very important for EPA's assessment of and upcoming revisions to the LCR.

Kindly,

Yanna Lambrinidou

Subject: RE: question about optimal WQP ranges for Flint's water

Dr. Lambrinidou,

All previous water quality parameter ranges would have been established for the City of Flint's wholesale finished water supplier, the Detroit Water and Sewerage Department, not the City of Flint itself.

As the City of Flint has not yet established optimized corrosion control treatment, the MDEQ is not yet at the point of regulatory requirements where the range of water quality parameters would be set.

Subject: question about optimal WQP ranges for Flint's water

Good morning Mr. Wurfel and Mr. Busch,

As a member of the EPA National Drinking Water Advisory Council (NDWAC) Lead and Copper Rule (LCR) workgroup that just completed its recommendations to EPA about the agency's upcoming revisions to the LCR, I am watching with great interest and concern the developments in Flint in relation to lead. I am looking for information on the optimal water quality parameter (WQP) ranges that MDEQ has set for Flint's water. Are those posted online? If so, could you send me the link? If not, could you let me know what they are?

Thank you kindly,

Clean water activists demand Detroit reconnection in Flint after lead study

By Molly Young | myoung7@mlive.com

The Flint Journal on September 28, 2015 at 2:54 PM, updated September 29, 2015 at 9:04 AM

FLINT, MI -- The Coalition for Clean Water is demanding Flint's administration switch back to purchasing water from Detroit after recent studies showed a spike in lead levels in drinking water and in children since the switch to Flint River water more than a year ago.

Dozens of people attended the conference, which was held in the lobby of Flint City Hall Monday morning, Sept. 28. After Pastor Alfred Harris Sr. gave opening remarks, Pastor Allen C. Overton, chair of the grassroots coalition, said during the conference that the recent studies have proven Flint water is unsafe, and that residents must continue pushing city officials for change.

"We have found all the facts, we have found all the information – it's time for the citizens of Flint to demand fresh, clean water from this administration. And they need to understand we are not going away and we want the water source changed immediately," Overton said during the conference.

At one point during the conference, attendees began chanting over Overton: "Fresh, clean water."

Harris said the coalition has met with Mayor Dayne Walling and has reached out to Governor Rick Snyder asking for a sit-down to discuss possible solutions.

Walling said during a press conference Friday, Sept. 25, that he believes the city's use of the river has resulted in an increased risk of lead leaching into drinking water because of the river water's corrosiveness and said he would consider support for reconnecting Flint to the Detroit water system again.

Overton said during the conference that the city has "skewed test procedures and otherwise misrepresented data to the MDEQ."

Walling denied those claims in an email to The Flint Journal on Monday afternoon.

"The City of Flint has followed the guidance from the Michigan Department of Environmental Quality and the U.S. Environmental Protection Agency. Claims to the contrary are false because the City is actually going above and beyond the required standards to ensure the community's health and safety," Walling said.

Walling, speaking at a news conference to issue a lead advisory for the city last week, said he's willing to discuss buying Detroit-treated Lake Huron water again, but he said that decision rests with Gov. Rick Snyder.

His comments came the day after a Hurley Medical Center doctor released a study showing increasing incidents of elevated blood lead levels in Flint children.

In his statement on Monday, Walling said the administration is looking for ways to address health risks in the system.

"I was troubled by the doctors' data on elevated blood levels and I am calling for the collective resources of the federal and state governments and local partners to address all of the immediate concerns and long-term risks with lead in our old system," Walling said. "Every option is on the table to fix Flint's water."

Flint's long-term drinking water plan is still to eventually draw water from a new pipeline to Lake Huron that's being built by the city and Genesee County through the Karegnondi Water Authority.

But the pipeline isn't expected to be completed until some time in 2016 and Flint has struggled with water quality and treatment since switching to the Flint River in the interim.

Overton said the coalition has since asked for a sit-down with city and state officials, but have not yet received a response. He said the coalition is weighing its options, including mass protests, in case there is no response or change announced soon.

"If we do not get a response from either of them we will begin to protest in this city like they have never seen before," Overton said.

Overton and Harris did not say when such an action would be taken, or exactly what it would entail, but insisted they will not back down.

Harris said that in the past, Flint has contributed in a major way to the state's financial stability, and now it's time for the state to repay the city by helping them find a source of clean water.

"Flint deserves the purist water source. Let the state pay for it. Let the federal government pay for it. Let the United Nations pay for it," Harris said.

City administrator asks Detroit about reconnecting Flint to Lake Huron

By Ron Fonger | rfonger1@mlive.com
The Flint Journal on September 28, 2015 at 7:45 PM, updated September 28, 2015 at 8:13 PM

FLINT, MI -- A key official inside City Hall says she's trying to broker a deal to reconnect Flint to the Detroit water system.

City Administrator Natasha Henderson said she's approached the Detroit Water and Sewerage Department about the potential reconnection because of recent concerns about lead levels in treated Flint River water.

Henderson told the City Council today, Sept. 28, that she's attempted to contact representatives of DWSD and the Great Lakes Water Authority, the consortium that will take over day-to-day operation of the Detroit system next year.

The move is significant because Henderson has broad powers in running the city and is the primary contact between the state-appointed Receivership Transition Advisory Board and the rest of city government.

"There is a better chance we would not have as much of a lead problem" if the city stopped using the Flint River, Henderson said. "It is more corrosive (than Detroit-treated Lake Huron water).

The Flint River water "can cause more problems," she said.

Henderson's statements today represent a shift in her approach to the issue of Flint drinking water.

Appointed to her position by former emergency manager Darnell Earley, Henderson has never previously publicly promoted reconnecting Flint to the Detroit water system.

Along with former emergency managers, Henderson has said previously that Flint could not afford to switch back to DWSD water and said today Flint still won't be able to pay for Detroit water without help or lower rates than have been proposed previously.

"I would like the state to help us get back to DWSD if that's possible," the city administrator said. "I would like for the state to help us do that."

Henderson's move comes just days after Mayor Dayne Walling opened the door to returning to the Detroit water system as work continues on the Karegnondi Water Authority pipeline.

Walling had been an advocate of using the Flint River as the city's source of drinking water since it switched from the Detroit water system in April 2014.

But the mayor shifted his approach to the issue last week after a report by Dr. Mona Hanna-Attisha, director of Hurley Medical Center's pediatric residency program, showed a near doubling of the percentage of children living in Flint with elevated blood lead levels since the switch to river water.

The Hurley study followed testing by Virginia Tech, which showed 10 percent of Flint homes tested by the university had 25 parts per billion of lead or more, far more than the allowable level -- 15 ppb -- set in federal guidelines.

City and state officials have said their testing shows Flint's water supply meets all health and safety regulations, never rising above 11 ppb in more than 10 percent of homes during the last 16 months, but data from the state shows lead levels have spiked since the city began using the river as its water source.

Henderson said a return to Detroit water wouldn't eliminate lead but could cut the amount of lead in tap water because treated river water is more corrosive than lake water.

State Sen. Jim Ananich, D-Flint, also today called on the state to assist the city in reconnecting to the Detroit water system until the completion of the KWA pipeline.

Dave Murray, a spokesman for Snyder, said in a statement today that the governor "and state agencies continue to work with city leaders, looking at a variety of approaches to the problem."

Several city residents continued to speak out about Flint's water during a City Council meeting today and some said Henderson and others should have acted long ago to end the use of river water.

"The city of Flint has eroded the public trust," said Nayyirah Shariff, a representative of the Democracy Defense League, one of the citizen groups fighting against use of the Flint River. "Our children and infants cannot be lost in the shuffle."

Flint schools chief seeking water donations for students after lead warning

By Sarah Schuch | sschuch@mlive.com The Flint Journal on September 28, 2015 at 4:05 PM, updated September 28, 2015 at 7:13 PM

FLINT, MI – The Flint School District is seeking donations for bottled water for students following last week's decision to stop using tap water at the schools, the superintendent said.

Donations and support have already started pouring in, but it's not enough, Flint Superintendent Bilal Tawwab said Monday, Sept. 28.

He urged the community to help at a news conference at Pierce Elementary.

"We need your help. On Friday, we all read the advisory as it relates to the water challenges here in Flint," Tawwab said during a press conference. "And I must say, as their champion, I'm going to stand for children and I unfortunately had to make the decision that at this time it would be best that our children no longer drink the water in our Flint Community Schools until further notice."

Two large water donations came to the Flint School District on Monday. Home Depot – the Burton and Pierson Road locations – donated 84 cases of water and were present during the press conference. Sams Club donated 72 cases that morning.

The district is asking students to avoid school drinking fountains and bring bottled water to school following a lead advisory issued by the city.

Infants and children are being found with elevated levels of lead in their blood since the city switched to using the Flint River as its water source, according to a new study by a Hurley Medical Center doctor.

The data showed that the percentage of infants and children with above-average lead levels has nearly doubled citywide, and has nearly tripled among children in "high risk" areas of lead exposure, according to the study.

The Flint School District issued an advisory Friday, Sept. 25, stating the district is developing an internal action plan to ensure student safety at school.

The district is asking that, effective immediately, families send their children to school with bottled water.

For those parents and families who are unable to send children to school with bottled water, Tawwab is asking for the community to fill in the gaps.

"I'm very excited, but I need for everyone in the community really wrap yourself around your community schools," he said. "We need all of our children to be in school ready to learn and to do that we need them to have excellent drinking water. So hopefully we'll all answer this call."

School officials have contacted the DEQ and will be getting the water from all the schools tested. Food preparation will also use bottled water where necessary until further notice.

Officials are working on turning off the switch to the drinking fountains in the schools and school administrators are being reminded to make sure students are supervised during school hours.

"I'm taking control over the part of the day I have control over. And that is the school day so I'm making sure while the kids are in my possession that they're going to have safe drinking water," Tawwab said.

Tawwab said he's proud that the school officials are doing what needs to be done to keep children safe and healthy, but now he's asking public officials to do the same.

"They are children here. So while the politicians want to sit back and talk about the water, whose responsibility it is, there are children here," Tawwab said. "This weekend, I'll be honest, I thought about my own youngsters in my family. I wouldn't have them drink the water. I wouldn't.

"Think about it. Even if they aren't your own children, there are children here and we must always think about making decisions that are best for our children. ... I want to see the city do what is best for kids. They must have clean drinking water."

---

http://michiganradio.org/post/flint-officials-exploring-return-detroit-water#stream/0

Flint officials exploring return to Detroit water

Steve Carmody / Michigan Radio

City Administrator Natasha Henderson is talking with the different groups needed to make the switch back to the Detroit Water and Sewerage Department.

The city switched from DWSD about a year and a half ago to the Flint River for the city’s drinking water. But the switch has been plagued with problems, from foul-smelling water to rising lead levels.

Mayor Dayne Walling says something must be done now.

“We need a comprehensive action plan in place this week,” says Walling.

The state will likely be asked to play a critical financial role.

Money is the key obstacle. Walling estimates going babck to DWSD will cost the city of Flint an extra $1.5 million a month.

It was the rising cost of Detroit water that led state-appointed emergency managers to decide to switch the city of Flint to a new water source.

The emergency manager signed a deal to hook up Flint to the new Karegnondi pipeline. The KWA pipeline will carry water from Lake Huron to Genesee County. But the KWA won't be online until 2016.

The Flint River was intended to bridge the gap between the end of the DWSD contract and the beginning of the KWA contract.

But since the switch was thrown in April 2014, Flint residents have complained about the smell, taste and appearance of the city's tap water.

More problems followed, including E. coli outbreaks and high levels of a potentially cancer-causing chemical.

Recently, multiple reports have revealed rising lead levels in Flint drinking water and in the blood of the city's young children.

Snyder must act on Flint lead crisis

By Nancy Kaffer, Detroit Free Press Columnist
11:11 a.m. EDT September 27, 2015

It's hard to understand the resounding yawn that seems to have emanated from the governor's office, following news that an increasing percentage of Flint kids have been lead poisoned after a switch in the city's water supply.

A spokeswoman for the Michigan Department of Health and Human Services sent a Free Press data analyst a chart she claimed would refute a report issued by a Hurley Medical Center researcher, who found that since the city started pumping water from the Flint River last April, the percentage of Flint kids with elevated blood-lead levels has more than doubled in some ZIP codes.

In fact, the state's data supports the Hurley researcher's claim — the number of kids with lead poisoning had been falling in Flint and across the state, until the water switch. Now it's increasing.

A spokeswoman for Gov. Rick Snyder wrote in an e-mail that the Hurley data had been “spliced and diced,” a suggestion that it’s something other than accurate — even though the state’s own data bolsters the Hurley report.

And officials across the administration have hastened to insist that Flint’s water is safe and to suggest that although published reports say Michigan Department of Environmental Quality data show elevated lead levels in Flint's water, there’s no reason to suspect that has caused more Flint kids to suffer from lead poisoning. And so far, none of it has it spurred them to action.

But here's the situation: There's more lead in Flint's water than there used to be. And more Flint kids have lead in their blood, something that leads to serious, irreversible behavioral and developmental problems.

How it happened

The City of Flint decided in 2013 to join the new Karegnondi Water Authority, along with Genesee, Sanilac and Lapeer counties. That system won't be complete until 2016. In the interim, the city — under former emergency manager Darnell Earley — opted to pump its water from the Flint River, instead of continuing to purchase it from the Detroit Water and Sewerage Department -- in part, state officials say, because DWSD planned to raise its rates for a short-term contract. The city considered blending Lake Huron and Flint River water, but ultimately chose to pull water from the Flint River alone. Genesee County, in contrast, will continue to purchase its water from DWSD while the new system is under construction.

Researchers say that Flint River water, more corrosive than the Lake Huron water pumped by the Detroit Water and Sewerage Department, is leaching lead from the city's aging infrastructure into the water supply.

The city, and its residents, need help. In the near term, residents — especially residents with formula-fed infants, whose diets are composed almost entirely of water — living in poverty need assistance to purchase bottled water or filtration systems. And the city needs to consider its long-term options, in particular, whether to reconnect to DWSD until the Karegnondi system is complete.

That wouldn't be a simple process. Former Flint EM Darnell Earley, now EM for Detroit Public Schools, wrote in an e-mailed statement that he was not involved in the decision to use river water, although it occurred during his tenure. He was also EM when a 9-mile section of pipe was sold to Genesee County, a decision he wrote was in the works before his appointment, meaning the city can't reconnect to the Detroit system without the cooperation of Genesee County.

Nor is the higher cost of buying water from DWSD — about $1.5 million a month — in the city's budget, Flint Mayor Dayne Walling said. The city, which emerged from state oversight this year, would need the approval of its transitional advisory board to increase its water budget.

Flint, by the way, is broke.

U.S. Rep. Dan Kildee and state Senate Majority Leader Jim Ananich, both Flint Democrats, have pledged to bring financial and practical assistance to the district.

For now, Walling said, Flint's water treatment plant will begin to add anticorrosive agents to the Flint River water, which will take weeks to impact the water supply.

If I lived in Flint, I'd be mad. If I were a Flint parent, with a child who'd spent the last year and a half drinking lead-contaminated water, I'd be in despair.

We're talking about a public health crisis — one that could have been avoided.

Whose fault is it?

During their tenures, emergency managers are the ultimate authority in the cities they serve.

And so the responsibility for Flint's water lies, ultimately, with Snyder, and the emergency managers he appointed — and it is Snyder who must come to Flint's rescue. Walling says Flint's residents need funds for immediate relief, but that the city needs grants to start to upgrade its aging, lead-ridden water infrastructure.

Snyder hasn't hesitated to appoint or retain emergency managers in struggling cities across the state, a stance the Free Press Editorial Board has largely supported, with one caveat: Emergency managers have to make things better.

That is the premise on which the emergency manager law is predicated. Cities are the creation of the state. The state has a responsibility to care for the health and welfare of its residents, and sometimes, cities face challenges not fixable at the local level. In those cases, the state must step in.

That's certainly the case in Flint, which has suffered from the same loss of population — and tax base — as Detroit, but with fewer assets with which to leverage a satisfactory outcome.

In those circumstances, the Free Press editorial board has argued, the state has a responsibility to act, to restore some fiscal stability, and thus service delivery and quality of life for residents.

That's the catch.

It'd be easy to balance any city's budget: Lay off all the cops, sell all the ambulances, liquidate the city parks. But that wouldn't make life better for residents. That's the balance emergency managers must be mindful of — cost savings versus quality of life. Spending cuts versus service delivery. A city's bottom line can't be profit-driven.

That is the glaring weakness in the emergency manager law, and it on full display in Flint.

Snyder spokeswoman Sara Wurfel said the state signed off on the switch at the behest of Walling and the Flint City Council, and only "with serious reservations."

That's not exactly how Walling remembers it.

"I didn’t support it one way or the other," he said. "It wasn’t my decision. I had a lot of concerns about it that I raised internally, but the budget was in place ... I had a lot of concerns about it, but when it was decided that was the decision ... I didn’t protest."

When the Flint City Council voted this year to reconnect to the Detroit water system, then-emergency manager Jerry Ambrose called its decision "incomprehensible": "Water from Detroit is no safer than water from Flint," Ambrose said, as reported in the Flint Journal.

It's pretty clear that's not true. It's not clear what anyone from the State of Michigan is prepared to do about it.

Sixteen months ago, Earley and Walling celebrated the city's departure from DWSD, raising glasses of Flint River water, prepared to toss them back, with a toast that strikes a hollow note today: Here's to Flint.

Snyder urged to help Flint reconnect to Detroit water

Chad Livengood, Detroit News Lansing Bureau 7:21 a.m. EDT September 29, 2015

Lansing — Senate Minority Leader Jim Ananich urged Gov. Rick Snyder on Monday to help Flint switch back to Detroit's water system after medical researchers found elevated levels of lead in children who consumed water from the Flint River over the past year.

Ananich, a Democrat who represents Flint, said the city of 99,000 residents faces a "public health crisis" after pediatricians at Hurley Medical Center discovered higher levels of lead in the blood of Flint children tested since the city stopped buying drinking water from Detroit 18 months ago.

“I’m going to keep pushing for swift transfer back to Detroit,” Ananich told The Detroit News. “I think that seems like the most logical decision to make at this point in time.”

Flint residents have been complaining about the odor, taste and smell of the city’s water since Flint stopped buying bulk water from Detroit’s water department in April 2014 and started pumping drinking water from the Flint River. The river is serving as a temporary water source until a new regional pipeline from Lake Huron goes online in late 2016.

Ananich participated in a conference call with Snyder and members of his administration on Monday morning.

“I’ve been stressing an urgency, that this is a public health crisis and we need to get in front of it,” Ananich said.

Ananich also sought emergency funding to supply Flint residents with bottled water and to purchase thousands of water filters for household faucets to help filter out lead from the city’s aging lead-lined pipes that service some 15,000 customers.

Snyder spokeswoman Sara Wurfel said the governor’s office is “reviewing” Ananich’s ideas.

“We believe protecting public health is paramount and safe, clean, accessible drinking water is essential,” Wurfel said. “That’s what we are focused on helping ensure and deeply share the senator’s commitment to helping address the issue.”

Flint officials have said they stopped buying Detroit’s water after the Detroit Water and Sewerage Department sought to hike the city’s monthly water bill by $1.5 million until Flint switched over to the new Karegnondi Pipeline Authority next year.

Last week, Genesee County pediatricians released a study of blood levels of Flint children younger than 5 between January 2013 and September 2013 when Flint used Detroit's water and January and September of this year when residents drank Flint River water.

The study found blood levels of lead in Flint children nearly doubled and in two Flint ZIP codes, the lead levels tripled. Federal officials have previously cited Flint for having high levels of a disinfectant by-product.

In a letter to Snyder Monday, Ananich said the city needs the state's assistance in negotiating a short-term water purchasing contract with the Detroit Water and Sewerage Department until a new pipeline project can be complete.

Earlier this year, Flint leaders rebuffed an offer by Detroit officials to reconnect Flint for $12 million more annually, The Detroit News reported in February.

“Your administration has the ability to ensure a financially acceptable and responsible contract between Flint and the Detroit Water and Sewerage Department, particularly in light of the public health implications with the Flint River supply,” Ananich wrote to Snyder.

The governor's office did not comment on Ananich's desire to have Flint switch back to Detroit's water supply.

But Wurfel noted the state has provided $4.2 million in grants and loans to help Flint add a carbon filtration system and test its water.

“We understand that residents are frustrated,” Wurfel said in an email.

Study suggests Flint's water causing increased lead poisoning

Michigan Radio Stateside Staff • 16 hours ago

Last year, Flint ended five decades of service from the Detroit Water and Sewerage Department. The city's going to take its water from a new pipeline from Lake Huron, but that won't be ready until some time next year.

In the meantime, Flint decided that rather than continuing to pay for Detroit water, it would get its drinking water from the Flint River.

Almost immediately after making that change, residents began complaining about the way their drinking water looked, smelled and tasted. There were issues with the chemicals used to treat the river water.

And now a study performed by pediatrician Dr. Mona Hanna-Attisha of the Hurley Medical Center has found an increase in the number of Flint children who have been lead poisoned since the switch to the Flint River water.

Hanna-Attisha says she looked at the blood lead levels of Flint residents from before and after the switch, and noticed that the percentage of children with elevated blood lead levels just about doubled.

“Pre-switch percent of children with elevated blood (lead) levels was 2.1%, and then after the switch it was 4%,” she says.

She adds that the data for children in the rest of Genessee County, which is sticking with Detroit water until the new pipeline is ready, showed no statistical change in blood lead levels.

Even more troubling, Hanna-Attisha says that state and national data showed blood lead levels in children dropping consistently year over year before the switch due to, "great public health efforts and education efforts and lead abatement efforts."

"Whenever you see that percentage staying the same or that percentage increasing, that is a red flag," she says.

There has been some concern surrounding Flint's infrastructure and how it affects the quality of the water, but Hanna-Attisha says that's not the key factor here.

"Infrastructure has a role, but this infrastructure hasn't changed. It was old then, it is old now, but these levels have increased. So what's changed is... the water," she says.

She explains that the Flint River water is more corrosive than the water from Lake Huron, so it is aging Flint's existing water infrastructure and causing the leaching of lead from these pipes.

According to Hanna-Attisha, "mountains and mountains of research" show that lead poisoning is linked with decreased IQ, behavioral issues, ADHD-like symptoms, and higher rates of violent offenses and incarcerations.

"It's just one of the absolute worst things that you could do for the life course of a child," Hanna-Attisha says.

The State Department of Health and Human Services, the Department of Environmental Quality and the Governor's office have downplayed and in some cases attempted to discredit Hanna-Attisha's findings, but she isn't swayed.

“I think it’s fascinating, because if you look at their data, it pretty much shows the exact same thing. Every year there was a decrease in the total percentage of kids with elevated blood lead levels, and then the year after the switch it jumped up.” she says. “You can’t fight the numbers, the numbers are there, everything is consistent.”

Hanna-Attisha advises that children, formula-fed infants and pregnant mothers in the area avoid tap water.

As for everyone else, she suggests running the water for five or so minutes before using it and only using cold water for cooking.

Here's a quick explainer for those trying to get a better understanding of the complicated water issues in Flint.

Anger over Flint's water woes is reaching a boiling point

Steve Carmody, Michigan Radio • 17 hours ago

Dozens of people chanted “Fresh, Clean Water” as they jammed the lobby of Flint city hall Monday.

The anger over the city’s long-simmering water problems is reaching a boiling point.

People have been complaining since April of last year, when the city switched from Detroit water to the Flint River as the city’s source of drinking water.

Concerns about the water’s taste and smell have been replaced by fears of rising lead levels in Flint’s drinking water. Virginia Tech researchers blame the "corrosiveness" of the Flint River for the elevated lead levels. Other research shows children’s blood lead levels in Flint have doubled since the switch.

A coalition of groups say the time has passed for further testing.

Pastor Allen Overton is calling on Gov. Snyder and Flint’s elected leaders to immediately return to getting the city’s drinking water from Detroit.

“If we do not get any response from either of them, we will begin to protest in this city like they have never seen before,” says Overton.

Flint pastors plan to meet with their attorney tomorrow to review their options.

Meanwhile, Gov. Snyder says his office is talking with Flint leaders and collecting facts. The governor declined to say what action might be taken next.

http://michiganradio.org/post/bottled-water-donations-flowing-flint-schools#stream/0

Bottled water donations flowing into Flint schools

Steve Carmody, Michigan Radio • 18 hours ago

It took five Home Depot employees a couple trips to unload a pickup truck filled with dozens of cases of bottled water into a classroom at a Flint elementary school this afternoon.

The donation was the largest, but far from the only, bottled water donation to Flint schools today.

School Superintendent Bilal Tawwab asked for donations after reports that Flint's drinking water contains "serious" lead levels. Last week, local hospital officials announced their tests showed blood lead levels in children in Flint had nearly doubled since the switch.

The timeline corresponds with the city's switch from the Detroit Water and Sewerage Department to the Flint River as the source of its drinking water.

Children are especially at risk when exposed to high lead levels.

Tawwab is grateful for the response his request has received so far. But he adds the more than 5,000 students in the Flint Community Schools will need more.

“We need a lot more donations like this,” Tawwab said as he stood in front of the 80-plus cases donated by two local Home Depots. “We just want to be able to meet the demand … so we're just going to take as much as you guys will give.”

Tawwab says he's asked the Michigan Department of Environmental Quality to come in and test the water in Flint school buildings.

He also asked state and local officials to come up with a solution to Flint's water woes.

Researchers from Virginia Tech blame the highly "corrosive" nature of the Flint River. They claim the river water is breaking down lead pipes and lead solder used in water pipes, creating lead levels in some homes at above 15 parts per billion.

Flint Mayor Dayne Walling has asked the state for $30 million to address the problem. $10 million would be for replacing lead pipes.

Clean water activists demand Detroit reconnection in Flint after lead study

By Molly Young | myoung7@mlive.com

The Flint Journal on September 28, 2015 at 2:54 PM, updated September 29, 2015 at 9:04 AM

FLINT, MI -- The Coalition for Clean Water is demanding Flint's administration switch back to purchasing water from Detroit after recent studies showed a spike in lead levels in drinking water and in children since the switch to Flint River water more than a year ago.

Dozens of people attended the conference, which was held in the lobby of Flint City Hall Monday morning, Sept. 28. After Pastor Alfred Harris Sr. gave opening remarks, Pastor Allen C. Overton, chair of the grassroots coalition, said during the conference that the recent studies have proven Flint water is unsafe, and that residents must continue pushing city officials for change.

"We have found all the facts, we have found all the information – it's time for the citizens of Flint to demand fresh, clean water from this administration. And they need to understand we are not going away and we want the water source changed immediately," Overton said during the conference.

At one point during the conference, attendees began chanting over Overton: "Fresh, clean water."

Harris said the coalition has met with Mayor Dayne Walling and has reached out to Governor Rick Snyder asking for a sit-down to discuss possible solutions.

Walling said during a press conference Friday, Sept. 25, that he believes the city's use of the river has resulted in an increased risk of lead leaching into drinking water because of the river water's corrosiveness and said he would consider support for reconnecting Flint to the Detroit water system again.

Overton said during the conference that the city has "skewed test procedures and otherwise misrepresented data to the MDEQ."

Walling denied those claims in an email to The Flint Journal on Monday afternoon.

"The City of Flint has followed the guidance from the Michigan Department of Environmental Quality and the U.S. Environmental Protection Agency. Claims to the contrary are false because the City is actually going above and beyond the required standards to ensure the community's health and safety," Walling said.

Walling, speaking at a news conference to issue a lead advisory for the city last week, said he's willing to discuss buying Detroit-treated Lake Huron water again, but he said that decision rests with Gov. Rick Snyder.

His comments came the day after a Hurley Medical Center doctor released a study showing increasing incidents of elevated blood lead levels in Flint children.

In his statement on Monday, Walling said the administration is looking for ways to address health risks in the system.

"I was troubled by the doctors' data on elevated blood levels and I am calling for the collective resources of the federal and state governments and local partners to address all of the immediate concerns and long-term risks with lead in our old system," Walling said. "Every option is on the table to fix Flint's water."

Flint's long-term drinking water plan is still to eventually draw water from a new pipeline to Lake Huron that's being built by the city and Genesee County through the Karegnondi Water Authority.

But the pipeline isn't expected to be completed until some time in 2016 and Flint has struggled with water quality and treatment since switching to the Flint River in the interim.

Overton said the coalition has since asked for a sit-down with city and state officials, but have not yet received a response. He said the coalition is weighing its options, including mass protests, in case there is no response or change announced soon.

"If we do not get a response from either of them we will begin to protest in this city like they have never seen before," Overton said.

Overton and Harris did not say when such an action would be taken, or exactly what it would entail, but insisted they will not back down.

Harris said that in the past, Flint has contributed in a major way to the state's financial stability, and now it's time for the state to repay the city by helping them find a source of clean water.

"Flint deserves the purist water source. Let the state pay for it. Let the federal government pay for it. Let the United Nations pay for it," Harris said.

City administrator asks Detroit about reconnecting Flint to Lake Huron

By Ron Fonger | rfonger1@mlive.com
The Flint Journal on September 28, 2015 at 7:45 PM, updated September 28, 2015 at 8:13 PM

FLINT, MI -- A key official inside City Hall says she's trying to broker a deal to reconnect Flint to the Detroit water system.

City Administrator Natasha Henderson said she's approached the Detroit Water and Sewerage Department about the potential reconnection because of recent concerns about lead levels in treated Flint River water.

Henderson told the City Council today, Sept. 28, that she's attempted to contact representatives of DWSD and the Great Lakes Water Authority, the consortium that will take over day-to-day operation of the Detroit system next year.

The move is significant because Henderson has broad powers in running the city and is the primary contact between the state-appointed Receivership Transition Advisory Board and the rest of city government.

"There is a better chance we would not have as much of a lead problem" if the city stopped using the Flint River, Henderson said. "It is more corrosive (than Detroit-treated Lake Huron water).

The Flint River water "can cause more problems," she said.

Henderson's statements today represent a shift in her approach to the issue of Flint drinking water.

Appointed to her position by former emergency manager Darnell Earley, Henderson has never previously publicly promoted reconnecting Flint to the Detroit water system.

Along with former emergency managers, Henderson has said previously that Flint could not afford to switch back to DWSD water and said today Flint still won't be able to pay for Detroit water without help or lower rates than have been proposed previously.

"I would like the state to help us get back to DWSD if that's possible," the city administrator said. "I would like for the state to help us do that."

Henderson's move comes just days after Mayor Dayne Walling opened the door to returning to the Detroit water system as work continues on the Karegnondi Water Authority pipeline.

Walling had been an advocate of using the Flint River as the city's source of drinking water since it switched from the Detroit water system in April 2014.

But the mayor shifted his approach to the issue last week after a report by Dr. Mona Hanna-Attisha, director of Hurley Medical Center's pediatric residency program, showed a near doubling of the percentage of children living in Flint with elevated blood lead levels since the switch to river water.

The Hurley study followed testing by Virginia Tech, which showed 10 percent of Flint homes tested by the university had 25 parts per billion of lead or more, far more than the allowable level -- 15 ppb -- set in federal guidelines.

City and state officials have said their testing shows Flint's water supply meets all health and safety regulations, never rising above 11 ppb in more than 10 percent of homes during the last 16 months, but data from the state shows lead levels have spiked since the city began using the river as its water source.

Henderson said a return to Detroit water wouldn't eliminate lead but could cut the amount of lead in tap water because treated river water is more corrosive than lake water.

State Sen. Jim Ananich, D-Flint, also today called on the state to assist the city in reconnecting to the Detroit water system until the completion of the KWA pipeline.

Dave Murray, a spokesman for Snyder, said in a statement today that the governor "and state agencies continue to work with city leaders, looking at a variety of approaches to the problem."

Several city residents continued to speak out about Flint's water during a City Council meeting today and some said Henderson and others should have acted long ago to end the use of river water.

"The city of Flint has eroded the public trust," said Nayyirah Shariff, a representative of the Democracy Defense League, one of the citizen groups fighting against use of the Flint River. "Our children and infants cannot be lost in the shuffle."

Flint schools chief seeking water donations for students after lead warning

By Sarah Schuch | sschuch@mlive.com The Flint Journal on September 28, 2015 at 4:05 PM, updated September 28, 2015 at 7:13 PM

FLINT, MI – The Flint School District is seeking donations for bottled water for students following last week's decision to stop using tap water at the schools, the superintendent said.

Donations and support have already started pouring in, but it's not enough, Flint Superintendent Bilal Tawwab said Monday, Sept. 28.

He urged the community to help at a news conference at Pierce Elementary.

"We need your help. On Friday, we all read the advisory as it relates to the water challenges here in Flint," Tawwab said during a press conference. "And I must say, as their champion, I'm going to stand for children and I unfortunately had to make the decision that at this time it would be best that our children no longer drink the water in our Flint Community Schools until further notice."

Two large water donations came to the Flint School District on Monday. Home Depot – the Burton and Pierson Road locations – donated 84 cases of water and were present during the press conference. Sams Club donated 72 cases that morning.

The district is asking students to avoid school drinking fountains and bring bottled water to school following a lead advisory issued by the city.

Infants and children are being found with elevated levels of lead in their blood since the city switched to using the Flint River as its water source, according to a new study by a Hurley Medical Center doctor.

The data showed that the percentage of infants and children with above-average lead levels has nearly doubled citywide, and has nearly tripled among children in "high risk" areas of lead exposure, according to the study.

The Flint School District issued an advisory Friday, Sept. 25, stating the district is developing an internal action plan to ensure student safety at school.

The district is asking that, effective immediately, families send their children to school with bottled water.

For those parents and families who are unable to send children to school with bottled water, Tawwab is asking for the community to fill in the gaps.

"I'm very excited, but I need for everyone in the community really wrap yourself around your community schools," he said. "We need all of our children to be in school ready to learn and to do that we need them to have excellent drinking water. So hopefully we'll all answer this call."

School officials have contacted the DEQ and will be getting the water from all the schools tested. Food preparation will also use bottled water where necessary until further notice.

Officials are working on turning off the switch to the drinking fountains in the schools and school administrators are being reminded to make sure students are supervised during school hours.

"I'm taking control over the part of the day I have control over. And that is the school day so I'm making sure while the kids are in my possession that they're going to have safe drinking water," Tawwab said.

Tawwab said he's proud that the school officials are doing what needs to be done to keep children safe and healthy, but now he's asking public officials to do the same.

"They are children here. So while the politicians want to sit back and talk about the water, whose responsibility it is, there are children here," Tawwab said. "This weekend, I'll be honest, I thought about my own youngsters in my family. I wouldn't have them drink the water. I wouldn't.

"Think about it. Even if they aren't your own children, there are children here and we must always think about making decisions that are best for our children. ... I want to see the city do what is best for kids. They must have clean drinking water."

http://michiganradio.org/post/flint-officials-exploring-return-detroit-water#stream/0

Flint officials exploring return to Detroit water

Steve Carmody / Michigan Radio

City Administrator Natasha Henderson is talking with the different groups needed to make the switch back to the Detroit Water and Sewerage Department.

The city switched from DWSD about a year and a half ago to the Flint River for the city's drinking water. But the switch has been plagued with problems, from foul-smelling water to rising lead levels.

Mayor Dayne Walling says something must be done now.

"We need a comprehensive action plan in place this week," says Walling.

The state will likely be asked to play a critical financial role.

Money is the key obstacle. Walling estimates going babck to DWSD will cost the city of Flint an extra $1.5 million a month.

It was the rising cost of Detroit water that led state-appointed emergency managers to decide to switch the city of Flint to a new water source.

The emergency manager signed a deal to hook up Flint to the new Karegnondi pipeline. The KWA pipeline will carry water from Lake Huron to Genesee County. But the KWA won't be online until 2016.

The Flint River was intended to bridge the gap between the end of the DWSD contract and the beginning of the KWA contract.

But since the switch was thrown in April 2014, Flint residents have complained about the smell, taste and appearance of the city's tap water.

More problems followed, including E. coli outbreaks and high levels of a potentially cancer-causing chemical.

Recently, multiple reports have revealed rising lead levels in Flint drinking water and in the blood of the city's young children.

Snyder must act on Flint lead crisis

By Nancy Kaffer, Detroit Free Press Columnist
11:11 a.m. EDT September 27, 2015

It's hard to understand the resounding yawn that seems to have emanated from the governor's office, following news that an increasing percentage of Flint kids have been lead poisoned after a switch in the city's water supply.

A spokeswoman for the Michigan Department of Health and Human Services sent a Free Press data analyst a chart she claimed would refute a report issued by a Hurley Medical Center researcher, who found that since the city started pumping water from the Flint River last April, the percentage of Flint kids with elevated blood-lead levels has more than doubled in some ZIP codes.

In fact, the state's data supports the Hurley researcher's claim — the number of kids with lead poisoning had been falling in Flint and across the state, until the water switch. Now it's increasing.

A spokeswoman for Gov. Rick Snyder wrote in an e-mail that the Hurley data had been “spliced and diced,” a suggestion that it’s something other than accurate — even though the state’s own data bolsters the Hurley report.

And officials across the administration have hastened to insist that Flint’s water is safe and to suggest that although published reports say Michigan Department of Environmental Quality data show elevated lead levels in Flint's water, there’s no reason to suspect that has caused more Flint kids to suffer from lead poisoning. And so far, none of it has it spurred them to action.

But here's the situation: There's more lead in Flint's water than there used to be. And more Flint kids have lead in their blood, something that leads to serious, irreversible behavioral and developmental problems.

How it happened

The City of Flint decided in 2013 to join the new Karegnondi Water Authority, along with Genesee, Sanilac and Lapeer counties. That system won't be complete until 2016. In the interim, the city — under former emergency manager Darnell Earley — opted to pump its water from the Flint River, instead of continuing to purchase it from the Detroit Water and Sewerage Department -- in part, state officials say, because DWSD planned to raise its rates for a short-term contract. The city considered blending Lake Huron and Flint River water, but ultimately chose to pull water from the Flint River alone. Genesee County, in contrast, will continue to purchase its water from DWSD while the new system is under construction.

Researchers say that Flint River water, more corrosive than the Lake Huron water pumped by the Detroit Water and Sewerage Department, is leaching lead from the city's aging infrastructure into the water supply.

The city, and its residents, need help. In the near term, residents — especially residents with formula-fed infants, whose diets are composed almost entirely of water — living in poverty need assistance to purchase bottled water or filtration systems. And the city needs to consider its long-term options, in particular, whether to reconnect to DWSD until the Karegnondi system is complete.

That wouldn't be a simple process. Former Flint EM Darnell Earley, now EM for Detroit Public Schools, wrote in an e-mailed statement that he was not involved in the decision to use river water, although it occurred during his tenure. He was also EM when a 9-mile section of pipe was sold to Genesee County, a decision he wrote was in the works before his appointment, meaning the city can't reconnect to the Detroit system without the cooperation of Genesee County.

Nor is the higher cost of buying water from DWSD — about $1.5 million a month — in the city's budget, Flint Mayor Dayne Walling said. The city, which emerged from state oversight this year, would need the approval of its transitional advisory board to increase its water budget.

Flint, by the way, is broke.

U.S. Rep. Dan Kildee and state Senate Majority Leader Jim Ananich, both Flint Democrats, have pledged to bring financial and practical assistance to the district.

For now, Walling said, Flint's water treatment plant will begin to add anticorrosive agents to the Flint River water, which will take weeks to impact the water supply.

If I lived in Flint, I'd be mad. If I were a Flint parent, with a child who'd spent the last year and a half drinking lead-contaminated water, I'd be in despair.

We're talking about a public health crisis — one that could have been avoided.

Whose fault is it?

During their tenures, emergency managers are the ultimate authority in the cities they serve.

And so the responsibility for Flint's water lies, ultimately, with Snyder, and the emergency managers he appointed — and it is Snyder who must come to Flint's rescue. Walling says Flint's residents need funds for immediate relief, but that the city needs grants to start to upgrade its aging, lead-ridden water infrastructure.

Snyder hasn't hesitated to appoint or retain emergency managers in struggling cities across the state, a stance the Free Press Editorial Board has largely supported, with one caveat: Emergency managers have to make things better.

That is the premise on which the emergency manager law is predicated. Cities are the creation of the state. The state has a responsibility to care for the health and welfare of its residents, and sometimes, cities face challenges not fixable at the local level. In those cases, the state must step in.

That's certainly the case in Flint, which has suffered from the same loss of population — and tax base — as Detroit, but with fewer assets with which to leverage a satisfactory outcome.

In those circumstances, the Free Press editorial board has argued, the state has a responsibility to act, to restore some fiscal stability, and thus service delivery and quality of life for residents.

That's the catch.

It'd be easy to balance any city's budget: Lay off all the cops, sell all the ambulances, liquidate the city parks. But that wouldn't make life better for residents. That's the balance emergency managers must be mindful of — cost savings versus quality of life. Spending cuts versus service delivery. A city's bottom line can't be profit-driven.

That is the glaring weakness in the emergency manager law, and it on full display in Flint.

Snyder spokeswoman Sara Wurfel said the state signed off on the switch at the behest of Walling and the Flint City Council, and only "with serious reservations."

That's not exactly how Walling remembers it.

"I didn't support it one way or the other," he said. "It wasn't my decision. I had a lot of concerns about it that I raised internally, but the budget was in place ... I had a lot of concerns about it, but when it was decided that was the decision ... I didn't protest."

When the Flint City Council voted this year to reconnect to the Detroit water system, then-emergency manager Jerry Ambrose called its decision "incomprehensible": "Water from Detroit is no safer than water from Flint," Ambrose said, as reported in the Flint Journal.

It's pretty clear that's not true. It's not clear what anyone from the State of Michigan is prepared to do about it.

Sixteen months ago, Earley and Walling celebrated the city's departure from DWSD, raising glasses of Flint River water, prepared to toss them back, with a toast that strikes a hollow note today: Here's to Flint.

Snyder urged to help Flint reconnect to Detroit water

Chad Livengood, Detroit News Lansing Bureau 7:21 a.m. EDT September 29, 2015

Lansing — Senate Minority Leader Jim Ananich urged Gov. Rick Snyder on Monday to help Flint switch back to Detroit's water system after medical researchers found elevated levels of lead in children who consumed water from the Flint River over the past year.

Ananich, a Democrat who represents Flint, said the city of 99,000 residents faces a "public health crisis" after pediatricians at Hurley Medical Center discovered higher levels of lead in the blood of Flint children tested since the city stopped buying drinking water from Detroit 18 months ago.

"I'm going to keep pushing for swift transfer back to Detroit," Ananich told The Detroit News. "I think that seems like the most logical decision to make at this point in time."

Flint residents have been complaining about the odor, taste and smell of the city's water since Flint stopped buying bulk water from Detroit's water department in April 2014 and started pumping drinking water from the Flint River. The river is serving as a temporary water source until a new regional pipeline from Lake Huron goes online in late 2016.

Ananich participated in a conference call with Snyder and members of his administration on Monday morning.

"I've been stressing an urgency, that this is a public health crisis and we need to get in front of it," Ananich said.

Ananich also sought emergency funding to supply Flint residents with bottled water and to purchase thousands of water filters for household faucets to help filter out lead from the city's aging lead-lined pipes that service some 15,000 customers.

Snyder spokeswoman Sara Wurfel said the governor's office is "reviewing" Ananich's ideas.

"We believe protecting public health is paramount and safe, clean, accessible drinking water is essential," Wurfel said. "That's what we are focused on helping ensure and deeply share the senator's commitment to helping address the issue."

Flint officials have said they stopped buying Detroit's water after the Detroit Water and Sewerage Department sought to hike the city's monthly water bill by $1.5 million until Flint switched over to the new Karegnondi Pipeline Authority next year.

Last week, Genesee County pediatricians released a study of blood levels of Flint children younger than 5 between January 2013 and September 2013 when Flint used Detroit's water and January and September of this year when residents drank Flint River water.

The study found blood levels of lead in Flint children nearly doubled and in two Flint ZIP codes, the lead levels tripled. Federal officials have previously cited Flint for having high levels of a disinfectant by-product.

In a letter to Snyder Monday, Ananich said the city needs the state's assistance in negotiating a short-term water purchasing contract with the Detroit Water and Sewerage Department until a new pipeline project can be complete.

Earlier this year, Flint leaders rebuffed an offer by Detroit officials to reconnect Flint for $12 million more annually, The Detroit News reported in February.

“Your administration has the ability to ensure a financially acceptable and responsible contract between Flint and the Detroit Water and Sewerage Department, particularly in light of the public health implications with the Flint River supply,” Ananich wrote to Snyder.

The governor’s office did not comment on Ananich’s desire to have Flint switch back to Detroit’s water supply.

But Wurfel noted the state has provided $4.2 million in grants and loans to help Flint add a carbon filtration system and test its water.

“We understand that residents are frustrated,” Wurfel said in an email.

Study suggests Flint's water causing increased lead poisoning

Michigan Radio Stateside Staff • 16 hours ago

Last year, Flint ended five decades of service from the Detroit Water and Sewerage Department. The city’s going to take its water from a new pipeline from Lake Huron, but that won’t be ready until some time next year.

In the meantime, Flint decided that rather than continuing to pay for Detroit water, it would get its drinking water from the Flint River.

Almost immediately after making that change, residents began complaining about the way their drinking water looked, smelled and tasted. There were issues with the chemicals used to treat the river water.

And now a study performed by pediatrician Dr. Mona Hanna-Attisha of the Hurley Medical Center has found an increase in the number of Flint children who have been lead poisoned since the switch to the Flint River water.

Hanna-Attisha says she looked at the blood lead levels of Flint residents from before and after the switch, and noticed that the percentage of children with elevated blood lead levels just about doubled.

“Pre-switch percent of children with elevated blood (lead) levels was 2.1%, and then after the switch it was 4%,” she says.

She adds that the data for children in the rest of Genessee County, which is sticking with Detroit water until the new pipeline is ready, showed no statistical change in blood lead levels.

Even more troubling, Hanna-Attisha says that state and national data showed blood lead levels in children dropping consistently year over year before the switch due to, “great public health efforts and education efforts and lead abatement efforts.”

“Whenever you see that percentage staying the same or that percentage increasing, that is a red flag,” she says.

There has been some concern surrounding Flint’s infrastructure and how it affects the quality of the water, but Hanna-Attisha says that’s not the key factor here.

“Infrastructure has a role, but this infrastructure hasn’t changed. It was old then, it is old now, but these levels have increased. So what’s changed is... the water,” she says.

She explains that the Flint River water is more corrosive than the water from Lake Huron, so it is aging Flint’s existing water infrastructure and causing the leaching of lead from these pipes.

According to Hanna-Attisha, “mountains and mountains of research” show that lead poisoning is linked with decreased IQ, behavioral issues, ADHD-like symptoms, and higher rates of violent offenses and incarcerations.

“It’s just one of the absolute worst things that you could do for the life course of a child,” Hanna-Attisha says.

The State Department of Health and Human Services, the Department of Environmental Quality and the Governor's office have downplayed and in some cases attempted to discredit Hanna-Attisha’s findings, but she isn’t swayed.

“I think it’s fascinating, because if you look at their data, it pretty much shows the exact same thing. Every year there was a decrease in the total percentage of kids with elevated blood lead levels, and then the year after the switch it jumped up.” she says. “You can’t fight the numbers, the numbers are there, everything is consistent.”

Hanna-Attisha advises that children, formula-fed infants and pregnant mothers in the area avoid tap water.

As for everyone else, she suggests running the water for five or so minutes before using it and only using cold water for cooking.

Here's a quick explainer for those trying to get a better understanding of the complicated water issues in Flint.

Anger over Flint's water woes is reaching a boiling point

Steve Carmody, Michigan Radio • 17 hours ago

Dozens of people chanted “Fresh, Clean Water” as they jammed the lobby of Flint city hall Monday.

The anger over the city’s long-simmering water problems is reaching a boiling point.

People have been complaining since April of last year, when the city switched from Detroit water to the Flint River as the city’s source of drinking water.

Concerns about the water’s taste and smell have been replaced by fears of rising lead levels in Flint’s drinking water. Virginia Tech researchers blame the "corrosiveness" of the Flint River for the elevated lead levels. Other research shows children’s blood lead levels in Flint have doubled since the switch.

A coalition of groups say the time has passed for further testing.

Pastor Allen Overton is calling on Gov. Snyder and Flint's elected leaders to immediately return to getting the city's drinking water from Detroit.

"If we do not get any response from either of them, we will begin to protest in this city like they have never seen before," says Overton.

Flint pastors plan to meet with their attorney tomorrow to review their options.

Meanwhile, Gov. Snyder says his office is talking with Flint leaders and collecting facts. The governor declined to say what action might be taken next.

http://michiganradio.org/post/bottled-water-donations-flowing-flint-schools#stream/0

Bottled water donations flowing into Flint schools

Steve Carmody, Michigan Radio • 18 hours ago

It took five Home Depot employees a couple trips to unload a pickup truck filled with dozens of cases of bottled water into a classroom at a Flint elementary school this afternoon.

The donation was the largest, but far from the only, bottled water donation to Flint schools today.

School Superintendent Bilal Tawwab asked for donations after reports that Flint's drinking water contains "serious" lead levels. Last week, local hospital officials announced their tests showed blood lead levels in children in Flint had nearly doubled since the switch.

The timeline corresponds with the city's switch from the Detroit Water and Sewerage Department to the Flint River as the source of its drinking water.

Children are especially at risk when exposed to high lead levels.

Tawwab is grateful for the response his request has received so far. But he adds the more than 5,000 students in the Flint Community Schools will need more.

"We need a lot more donations like this," Tawwab said as he stood in front of the 80-plus cases donated by two local Home Depots. "We just want to be able to meet the demand … so we're just going to take as much as you guys will give."

Tawwab says he's asked the Michigan Department of Environmental Quality to come in and test the water in Flint school buildings.

He also asked state and local officials to come up with a solution to Flint's water woes.

Researchers from Virginia Tech blame the highly "corrosive" nature of the Flint River. They claim the river water is breaking down lead pipes and lead solder used in water pipes, creating lead levels in some homes at above 15 parts per billion.

Flint Mayor Dayne Walling has asked the state for $30 million to address the problem. $10 million would be for replacing lead pipes.

Subject: RE: Flint Corrosion Control?

Hi Miguel - sorry, I should have been more specific in my previous email. The rules you stated below allow large systems to be considered having optimal corrosion control if they have data from two consecutive 6 month monitoring periods that meet specific criteria. DEQ-ODWMA has not made a formal decision as to whether or not the City of Flint meets the exemption criteria or will be required to do a corrosion control study since Flint has only completed one round of 6 month monitoring. The City of Flint's second round of monitoring will be completed by June 30, 2015, and we will make a formal decision at that time. If my memory is correct, this is consistent with the process followed in the early 1990's for large systems when the Pb/Cu rule was first implemented. The Department waits until large systems complete both rounds of full scale, 6 month monitoring before making a decision about optimal corrosion control. If it is determined that Flint has to install corrosion control treatment, the rule allows up to 2 years to complete a study and 2 additional years to install the treatment unless we set a shorter time frame.

As Flint will be switching raw water sources in a just over one year from now, raw water quality will be completely different than what they currently use. Requiring a study at the current time will be of little to no value in the long term control of these chronic contaminants.

Finally, the City of Flint's sampling protocols for lead and copper monitoring comply will all current state and federal requirements. Any required modifications will be implemented at the time when such future regulatory requirements take effect.

Subject: Re: Flint Corrosion Control?

Hi Pat,

I'll be heading out to MI for RTCR tomorrow and won't see email until next Tuesday, but I wanted to follow up on this because Flint has essentially not been using any corrosion control treatment since April 30, 2014 and they have LSLs. Given the very high lead levels found at one home and the pre-flushing happening at Flint, I'm worried that the whole town may have much higher lead levels than the compliance results indicated, since they are using pre-flushing ahead of their compliance sampling.

If the source water lead is non-detect (zero), then according to 141.89(a)(3) they should use zero for that source water value:

"All lead and copper levels measured between the PQL and MDL must be either reported as measured or they can be reported as one-half the PQL specified for lead and copper in paragraph (a)(1)(ii) of this section. All levels below the lead and copper MDLs must be reported as zero."

As far as the treatment determination, there are only two scenarios for a large system to be deemed to have optimized corrosion control without treatment and Flint does not appear to meet either:

The first is at 141.81(b)(3)

Any water system is deemed to have optimized corrosion control if it submits results of tap water monitoring conducted in accordance with § 141.86 and source water monitoring conducted in accordance with § 141.88 that demonstrates for two consecutive 6-month monitoring periods that the difference between the 90th percentile tap water lead level computed under §141.80(c)(3), and the highest source water lead concentration is less than the Practical Quantitation Level for lead specified in § 141.89(a)(1)(ii).

If Flint's highest source water lead was zero, and their 90th percentile was 0.006, then Flint does not meet this criteria, because the difference must be LESS THAN the PQL (i.e., 0.004 or less). 0.006 - 0 = 0.006.

The second is at 141.81(b)(3)(i):

Those systems whose highest source water lead level is below the Method Detection Limit may also be deemed to have optimized corrosion control under this paragraph if the 90th percentile tap water lead level is less than or equal to the Practical Quantitation Level for lead for two consecutive 6-month monitoring periods.

Although Flint's source water lead was non-detect (zero), the 90th percentile lead level is 0.006 which is above the PQL of 0.005, so Flint would not meet this criteria either.

Am I missing something?

Subject: RE: Flint Corrosion Control?

Hi Miguel - Flint is currently not practicing corrosion control treatment at the WTP. When they started treating water at their WTP last spring, we placed them on full chart (100 sites) Pb/Cu monitoring for two consecutive 6 month periods. WQ monitoring is also being conducted. The first round of samples after switch-over from DWSD (July 1, 2014 – Dec 31, 2014) had 90th percentiles of 6 ppb for Lead and 110 ppb for Copper. The second round of samples (Jan 1, 2015 – June 30, 2015) is underway with approximately 20 of the 100 sample site results in. The highest lead result out of the 20 received thus far is 13 ppb.

Based on the matrix of recommended corrosion control study components for Large PWS's for both Lead and Copper, there are no additional requirements for the City of Flint based on the levels of lead and copper in the current source water and the results of the lead and copper distribution monitoring. The only provision of the Lead & Copper Rule which classifies the existing treatment of large PWSs as optimized for corrosion control is when the difference between the 90% Pb-TAP and Pb-POE is less than the lead practical quantitative level (PQL) for each six-month period of the initial monitoring program. By definition, the PQL for lead is 0.005 mg/L; and the lead value for the source water used in this determination is the highest source water lead concentration. If this condition is met, then no study or testing is required. We believe this condition has been met for Flint. However, we will re-evaluate this after the 2nd round of 6 month sampling is completed.

If you have any further questions, please contact the Lansing District Supervisor, Steve Busch at (517) 643-2314 or at buschs@michigan.gov.

Have a good (and hopefully warm) weekend!

The State and City are pulling together a "ten point plan" and they have asked for EPA's help to work out the details. The goal is to have a press conference on Thursday or Friday to announce the following:

1. Bottled water and pre-mixed formula for households with infants and children (the Michigan Department of Health and Human Services is working with USDA to do this through the WIC program)

2. Lead filters for households with infants and children (a group of nonprofits has pledged $1 million for this purpose and will be working with the Meijer discount chain to obtain filters at wholesale.)

3. Water will be tested for lead in all Flint schools. (MDEQ)

4. Water will be tested for lead in all Flint households with lead service lines that have infants and children. (MDEQ)

5. All other Flint households can request a free water test. (MDEQ)

6. The State will step up health advisory/public education efforts to encourage flushing and use of filters (MDEQ/MDHHS)

7. MDEQ will establish an end date for Flint to complete implementation of fully-optimized corrosion control – and move up the start date to commence implementation of corrosion control. (The current start date is 1/16)

8. MDEQ will expand the City's Technical Advisory Committee by adding several University of Michigan scientists and will immediately convene the committee. (This committee includes ORD scientists from the Cincinnati Lab)

9. The State of Michigan's "Chief Medical Executive" will oversee a review of data that has been collected on Flint children's blood lead levels.

10. MDEQ will help Flint finance accelerated replacement of lead service lines (using SRF)

The Mayor and Director Wyant have asked Susan to go to Flint to participate in the press conference. The Mayor has also asked Susan to meet with a group of faith leaders who have been very vocal on this issue: http://www.abc12.com/home/headlines/Rally-held--329788391.html

The draft response below is based on input from Tom Poy and the previous approved desk statement:

EPA is working to finalize the field report. In the meantime, EPA and the Michigan Department of Environmental Quality are working closely with the city of Flint to ensure that residents are provided with safe drinking water. In response to EPA and MDEQ recommendations, Flint has decided to implement corrosion control treatment and will receive EPA technical assistance to help with that effort.

EPA advises everyone across the country to flush their pipes before drawing drinking water to reduce exposure to lead. The more time water has been sitting in your home's pipes, the more lead it may contain. Anytime the water in a particular faucet has not been used for six hours or longer, "flush" the cold-water pipes by running the water before drinking and remember to use only cold water for drinking, cooking, and preparing baby formula. Flushing times can vary based on the plumbing configuration in the home and whether the home has a lead service line.

Flint residents that are concerned about lead in their drinking water should contact the water utility and may request sampling. Additional information about lead in drinking water is available at: http://water.epa.gov/drink/contaminants/basicinformation/lead.cfm.

Subject: RE: MDEQ policy under LCR

The original letter that described the Modified Consecutive System approach for Detroit (1991 letter), stated there were 5 water treatment plants using 3 intakes in Lake Huron and in the Detroit River, and all the network of transmission mains, pump stations and reservoirs were under the control of DWSD. The wholesale customers did not alter the water quality or pressure or have the capability to provide additional treatment. At that time, the State said that the individual customers would have no practical way to implement corrosion control measures because of multiple feed points with water delivered on demand from various Detroit reservoirs and different pressure districts. (Flint was not discussed specifically in this letter). It made sense to treat the entire Detroit service area as one system; then all the consecutive systems would be on the same schedule, would sample during the same time periods, and this data would all feed back to the 5 water treatment plants, so they could design the appropriate CCT.

I believe the 90th percentile of lead in Flint during the Detroit days, was 6ppb. So, if a water system is exceeding the AL and it is a consecutive system, the State could say that it has OCCT, and the system would need to do PE and replace LSLs, according to the rule. If the rule doesn't require it, the State most likely won't do it under the current thinking at MDEQ.

But, it would be a reasonable request to negotiate a change in the consecutive system policy. Each system will be a unique situation, depending on wholesale OCCT, piping network, source water, feed points from various sources in the distribution system. Most consecutive systems in Detroit in the early 90's had no treatment, so if no existing treatment, adding CCT could be quite expensive.

Another issue to ponder.

Subject: flint --> lcr milestone data in sdwis/fed (no info for flint; deem for detroit)

Hi All,

Miguel asked for the LCR milestone data we have in SDWIS/FED for Flint and Detroit. I thought it might be useful for the whole group. For reference, all of the DEEM, DONE, and LSLR data for MI from SDWIS/FED is attached.

There is nothing in SDWIS/FED for Flint DEEM, DONE, or LSLR. There is a DEEM for Detroit, as follows:

PWSID	PWS_NAME	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
MI0001800411	DETROIT CITY OF	6/30/1999	5/19/2004	DEEM	System deemed optimized without OCCT	B3	Serving greater than 50,000: met action levels

Isn't it well known that SDWIS/FED data for LCR milestones are unreliable and incomplete? As such, I'm not sure how much we can read into Flint not having any DEEM or DONE milestones in our database.

If there are any other data questions, just let me know. I'm happy to help.

Thanks,

Andrea Porter

Subject: RE: Long term treatment change/new source citations

I am just wondering when Detroit was deemed optimized, did the notification automatically apply to the consecutives, and were they notified, or did each consecutive get treated as an individual system with separate notification of optimization.

Did the state approve the new source in writing per 141.90 (a)(3)

(3) At a time specified by the State,

or if no specific time is designated by

the State, then as early as possible

prior to the addition of a new source or

any long-term change in water treatment, a water system deemed to have optimized corrosion control under § 141.81(b)(3), a water system subject to reduced monitoring pursuant to § 141.86(d)(4), or a water system subject to a monitoring waiver pursuant to § 141.86(g), shall submit written documentation to the State describing the change or addition. The State must review and approve the addition of a new source or long-term change in treatment before it is implemented by the water system. Examples of long-term treatment changes include the addition of a new treatment process or modification of an existing treatment process. Examples of modifications include switching secondary disinfectants, switching coagulants (e.g., alum to ferric chloride), and switching corrosion inhibitor products (e.g., orthophosphate to blended phosphate). Long-term changes can include dose changes to existing chemicals if the system is planning long-term changes to its finished water pH or residual inhibitor concentration. Long-term treatment changes would not include chemical dose fluctuations associated

with daily raw water quality changes

Subject: Long term treatment change/new source citations

Here are the three places that discuss long-term treatment change and new source requirements and state authorities.

Long-term Change(s) in Treatment or Addition of New Source(s)

This first provision applies to systems that are deemed optimized in accordance with the criteria in 141.81(b)(3) [low lead levels]

141.81(b)(3)(iii)

Any water system deemed to have optimized corrosion control pursuant to this paragraph shall notify the State in writing pursuant to § 141.90(a)(3) of any upcoming long-term change in treatment or addition of a new source as described in that section. The State must review and approve the addition of a new source or long-term change in water treatment before it is implemented by the water system. The State may require any such system to conduct additional monitoring or to take other action the State deems appropriate to ensure that such systems maintain minimal levels of corrosion in the distribution system.

This second provision applies to all systems on reduced monitoring

141.86(d)(4)(vii)

Any water system subject to a reduced monitoring frequency under paragraph (d)(4) of this section shall notify the State in writing in accordance with § 141.90(a)(3) of any upcoming long-term change in treatment or addition of a new source as described in that section. The State must review and approve the addition of a new source or long-term change in water treatment before it is implemented by the water system. The State may require the system to resume sampling in accordance with paragraph (d)(3) of this section and collect the number of samples specified for standard monitoring under paragraph (c) of this section or take other appropriate steps such as increased water quality parameter monitoring or re-evaluation of its corrosion control treatment given the potentially different water quality considerations.

This third provision is only applicable to systems that get lead/copper monitoring waivers and would not apply to Flint.

141.86(g)(4)(iii)

Any water system with a full or partial waiver shall notify the State in writing in accordance with § 141.90(a)(3) of any upcoming long-term change in treatment or addition of a new source, as described in that section. The State must review and approve the addition of a new source or long-term change in water treatment before it is implemented by the water system. The State has the authority to require the system to add or modify waiver conditions (e.g., require recertification that the system is free of lead-containing and/or copper-containing materials, require additional round(s) of monitoring), if it deems such modifications are necessary to address treatment or source water changes at the system.

Subject: WHAT ARE YOU GUYS DOING DOWN THERE?

Wurfel says to NPR you have to poison kids for a year before implementing corrosion control, and to determine the right orthophosphate dose?

Eric, is this going to be part of the new improved LCR? And is EPA going to hand Miguel's draft memo to Wurfel, to finalize and/or approve? Wurfel PROMISES THAT the final memo is going to tell a different story. And Miguel is now a ROGUE EPA employee?

EPA Office of Water and EPA Region 5 are a national embarrassment. You have a city in crisis, kids with elevated blood lead, and NO CORROSION CONTROL PLAN FOR 16 MONTHS, and yet you sit there and do absolutely nothing.

Marc

http://www.npr.org/2015/09/29/444497051/high-lead-levels-in-michigan-kids-after-city-switches-water-source

A draft report from the EPA that was obtained by the ACLU of Michigan also takes the city and state to task.

"Prior to April 30, 2014, the City of Flint purchased finished water from the City of Detroit which contained orthophosphate, a treatment chemical used to control lead and copper levels in the drinking water," the report read, adding that the treatment was discontinued after the switch to Flint River water.

"In accordance with the Lead and Copper Rule (LCR), all large systems ... are required to install and maintain corrosion control treatment for lead and copper. In the absence of any corrosion control treatment, lead levels in drinking water can be expected to increase," the report continued.

A Solution May Be Near

But officials with the Michigan Department of Environmental Quality dispute the findings of the draft report. MDEQ spokesman Brad Wurfel says the report was the work of a "rogue employee," and promised the final report — not yet released — would tell a much different story.

"You have to have to do a full year of studying" the water chemistry as it behaves across the system before implementing corrosion control, Wurfel says, adding that's the only way to know how much phosphate to add to the water.

Cc: Shoven, Heather; Porter, Andrea; Deltoral, Miguel
Subject: RE: MDEQ policy under LCR

The original letter that described the Modified Consecutive System approach for Detroit (1991 letter), stated there were 5 water treatment plants using 3 intakes in Lake Huron and in the Detroit River, and all the network of transmission mains, pump stations and reservoirs were under the control of DWSD. The wholesale customers did not alter the water quality or pressure or have the capability to provide additional treatment. At that time, the State said that the individual customers would have no practical way to implement corrosion control measures because of multiple feed points with water delivered on demand from various Detroit reservoirs and different pressure districts. (Flint was not discussed specifically in this letter). It made sense to treat the entire Detroit service area as one system; then all the consecutive systems would be on the same schedule, would sample during the same time periods, and this data would all feed back to the 5 water treatment plants, so they could design the appropriate CCT.

I believe the 90th percentile of lead in Flint during the Detroit days, was 6ppb. So, if a water system is exceeding the AL and it is a consecutive system, the State could say that it has OCCT, and the system would need to do PE and replace LSLs, according to the rule. If the rule doesn't require it, the State most likely won't do it under the current thinking at MDEQ.

But, it would be a reasonable request to negotiate a change in the consecutive system policy. Each system will be a unique situation, depending on wholesale OCCT, piping network, source water, feed points from various sources in the distribution system. Most consecutive systems in Detroit in the early 90's had no treatment, so if no existing treatment, adding CCT could be quite expensive.

Another issue to ponder.

Subject: Re: FYI from HQ: Flint happenings

Same concern. I talked with Mike Schock about how we might be able to help Flint find the lead line sites. There is some good work that was done up north in Canada with some equipment that might be useable in Flint. Starting estimate per Mike - the analyzer runs under $2000 per unit, and it would essentially cost about $8 per test to check the home. This willl add up unless we can definiitely identify the areas with the lead lines. There are ways to prioritize which homes to check first.

The other issue is that Mike and Darren are going to need data (lots of it) to make appropriate recommendations. The only way to do that is boots on the ground. I think the MI universities may be able to help with sample collection and WQ measurements that and I assume our lab can run the samples. Virginia Tech might be interested in helping out as well since **I think** I saw that the City has invited Marc for the advisory meetings.

Hi Heather,

Interesting message. Begs a couple of questions though. Have they suddenly discovered where all of the lead service lines are? They didn't seem to know before. What sampling protocol are they going to use when sampling the schools and homes? Will the samples from the households be considered compliance samples? Will Darren & Mike be the EPA folks helping to "work out the details"? (I hope so – everything else is either Flint or the state). I would hope the plan gets a "thumbs up" from our technical folks before we go out publically endorsing it.

High Lead Levels In Michigan Kids After City Switches Water Source

NPR All Things Considered

September 29, 2015 6:01 PM ET

Doctors are finding elevated levels of lead in the children in Flint, Mich., and local tap water is the likely cause.

That's the latest alarming news to come out of the city, which switched its water source about a year and a half ago.

A pediatrician with Hurley Medical Center analyzed lead levels of hundreds of children. She compared blood tests before and after April 2014. That's when Flint, unable to come to an agreement on a short-term contract with Detroit, quit buying water from its system, and signed on with a new system that will draw water from Lake Huron.

But that system won't be online until next year. So in the interim, with assurances from the state that it would be safe, the city decided to pump water from the Flint River.

Dr. Mona Hanna-Attisha's research found that the percentage of Flint children 5 years and younger with elevated lead levels nearly doubled after the switch, from 2.1 percent to 4 percent.

"My research shows that lead levels have gone up," Hanna-Attisha says. "I cannot say it's from the water. But that's, you know, the thing that has happened."

A Cascade Of Problems

The news did not surprise Lee Anne Walters. She suspected the water had something to do with health problems in her 4-year-old son, Gavin.

"I kept talking to the doctors, trying to figure out why he wasn't growing," she says. "He was 27 pounds at 4 years old. His hair was thinning, breaking out in rashes."

Complaints about foul-smelling, discolored water began soon after the city started drawing water from the Flint River. In the summer of 2014, the city issued a notice for residents to boil their water because of E. coli contamination.

Then the city was found to be in violation of the Safe Drinking Water Act because of high levels of a disinfectant byproduct called total trihalomethanes — an unintended consequence from all the chlorine the city had to use to kill the E. coli.

Walters says her whole family broke out in rashes, and they stopped drinking the water in December.

Then, in February of this year, the city tested her water for lead.

"And I got a frantic phone call from the water department telling me to please make sure my kids didn't drink the water, don't mix their juice with it, because they had never seen a number that high for lead," she says.

After that, Walters decided to take Gavin in to be tested for lead.

He'd been tested before the city switched its water source. At that time, he had a level of 2 micrograms of lead per deciliter of blood. After the switch, his level was 6.5.

The Centers for Disease Control and Prevention says a level of 5 is considered "much higher" than that found in most children. It also says there is no safe level of lead exposure — and the effects, like lower IQ, are irreversible.

A Failure Of Government?

The day after Hanna-Attisha released her findings, the city put out a lead advisory, urging people to flush their pipes, install inexpensive filters, and use cold water for mixing baby formula.

"As a father, I want every family and household in the city of Flint to be safe and secure," Mayor Dayne Walling said at a press conference to announce the advisory.

Over the summer, researchers from Virginia Tech found that Flint River water is highly corrosive. That means when it comes into contact with lead from service lines, household pipes or solder, it eats away at the lead and sends it right to people's faucets.

City officials and state regulators say they're now putting together a corrosion control plan to reduce lead exposure.

"Flint is the only city in America that I'm aware of that does not have a corrosion control plan," said Virginia Tech's Marc Edwards, who led the research.

Edwards also uncovered lead contamination in Washington, D.C. He says Flint's lead levels are not as high, and the exposure period is not as long as it was in that city. But he has some harsh criticism of city and state officials for how they've handled the Flint situation.

"It was clearly a failure of government agencies to do their job to protect the public," says Edwards, citing the absence of a corrosion control plan from the outset.

A draft report from the EPA that was obtained by the ACLU of Michigan also takes the city and state to task.

"Prior to April 30, 2014, the City of Flint purchased finished water from the City of Detroit which contained orthophosphate, a treatment chemical used to control lead and copper levels in the drinking water," the report read, adding that the treatment was discontinued after the switch to Flint River water.

"In accordance with the Lead and Copper Rule (LCR), all large systems ... are required to install and maintain corrosion control treatment for lead and copper. In the absence of any corrosion control treatment, lead levels in drinking water can be expected to increase," the report continued.

A Solution May Be Near

But officials with the Michigan Department of Environmental Quality dispute the findings of the draft report. MDEQ spokesman Brad Wurfel says the report was the work of a "rogue employee," and promised the final report — not yet released — would tell a much different story.

"You have to have to do a full year of studying" the water chemistry as it behaves across the system before implementing corrosion control, Wurfel says, adding that's the only way to know how much phosphate to add to the water.

An announcement about the corrosion control plan is expected soon. Meanwhile, city officials are showing increasing interest in returning to Detroit's water system — something that even a few days ago they dismissed as economically unfeasible for the cash-strapped city.

Whatever the solution, residents like Lee Anne Walters say they hope the city can reach one soon.

"I want them to take responsibility," Walters says. "I want them to quit poisoning their citizens."

Report: Using Flint River proving costly to city's water system

Steve Carmody, Michigan Radio • 28 minutes ago

A new report (http://flintwaterstudy.org/) estimates it will cost the city of Flint $1.5 billion to repair the damage done since the switch to the Flint River as a water source.

Researchers from Virginia Tech based their estimate on the tests of the corrosiveness of the Flint River.

The researchers say the corrosiveness is “eating away” lead pipes, aging the system by more than 11.5 years in just the last 16 months.

City and state leaders are talking about taking steps to fix Flint’s water problems.

One option on the table might be returning to Detroit water. But Flint will probably need help from the state to do that.

http://www.detroitnews.com/story/news/politics/2015/09/29/govs-office-helps-get-water-filters-flint-families/73055442/

Gov's office helps get water filters to Flint families

Chad Livengood, Detroit News Lansing Bureau 6:30 p.m. EDT September 29, 2015

Gov. Rick Snyder's office quietly orchestrated the distribution of 1,500 water filters to Flint families this summer while insisting the city's water is safe to drink.

In July, Snyder's office worked with an anonymous corporate donor to distribute the faucet filters through a group of Flint pastors, Snyder spokesman Dave Murray said Tuesday. It was unclear who initiated the plan — the donor, the governor's office or someone else.

"We worked with the pastors' group to distribute the filters and asked that members respect the donor's wishes not to be identified," Murray said. "We told the group that we're not looking for credit and appreciated the pastors' efforts in working with the community on this effort."

Snyder's office acknowledged its role Tuesday in handing out the free filters to Flint residents while pressure is mounting on state agencies to fix Flint's troubled water system. A study last week showed elevated levels of lead in the blood of Flint children younger than 5.

"People have complained about the color and the odor, and faucet filters will help with those challenges as well as improving water quality overall," Murray said.

The governor's office is in discussions with "a number of groups that are interested" in distributing more faucet filters, Murray said.

The water filters can remove chemical compounds as well as lead, a toxic metal that can hinder brain development in young children even at low levels, according to the U.S. Environmental Protection Agency.

Flint residents began complaining about the taste and color of the city's water in April 2014 when the city halted a half-century of purchasing water from the Detroit Water and Sewerage Department and started pumping drinking water from the Flint River.

River water is a trickier source for municipal cleaning and distribution than Lake Huron, where the Detroit system gets its water. The deeper, still waters of the lake contain few of the organic materials found in river water and require a different treatment protocol.

The Flint River is serving as a temporary water source until the city can connect to a new regional water pipeline from Lake Huron that won't be ready until late 2016.

A year ago, General Motors' Flint Engine Operations plant stopped using the city's river because of concerns about corrosive effects and now gets its water from Flint Township.

Last week, pediatricians at Hurley Medical Center released a study of blood levels of Flint children younger than 5 between January 2013 and September 2013 when Flint used Detroit's water and January and September of this year when residents drank Flint River water.

But Flint's water tested below the federal limit for lead in the Michigan Department of Environmental Quality's 2014 testing, DEQ spokesman Brad Wurfel said Tuesday.

Still, the state agency is working closely to address a "crisis of confidence" among Flint residents, Wurfel said. "Even though it is meeting standards, there is a significant concern in the city of Flint," he said.

Senate Minority Leader Jim Ananich, D-Flint, has urged Snyder to seek emergency funding to distribute faucet filters to about 15,000 Flint homes.

Ananich also wants the governor to get Flint reconnected to Detroit's water system.

In January, the Detroit water system offered to reconnect water service to Flint because of the complaints. Flint officials rebuffed the offer, saying an analysis concluded it would cost Flint an additional $12 million per year or more.

Snyder has been non-committal to Ananich's proposals, but said Tuesday his administration will be taking action soon.

"I have a large team of people working on the Flint water issue as we speak," Snyder said after an event in Lansing. "What I would say is during the course of the week or early next week, hopefully we'll be coming out with more public action steps ... and more action steps to take in the future.

"I take it as a serious issue, the Flint water situation. Lead's a serious issue, so we're spending a lot of time and effort looking at that and trying to partner with the people in Flint on that issue."

Flint mayor to state: Approve plan "as fast as humanly possible" to help keep lead out of water

Lindsey Smith , Michigan Radio • 14 hours ago

Flint hasn't been using any corrosion-control method since it switched from Detroit's water system in April 2014. Corrosion-control treatment helps keep lead out of drinking water. Since the switch, more kids are showing up with elevated levels of lead in their blood.

Flint Mayor Dayne Walling says he wants to put corrosion-control treatment back in place, but he needs state approval first. The state says it's going to take a little while to implement.

"One of my requests to (Michigan's) Department of Environmental Quality director is that (approval) be accelerated as fast as humanly possible," Walling said.

"Whatever decisions are coming next, we need that corrosion control in the water treatment process that we have now," he said.

Walling was a guest today on Stateside with Cynthia Canty. (Listen to Flint Mayor Dayne Walling on Stateside: http://cpa.ds.npr.org/michigan/audio/2015/09/20150929-SS-FLINT-WATER.mp3)

Flint spokesman Jason Lorenz says MDEQ made the recommendation to put corrosion-control treatment into the water supply last month. But, he says, it needs MDEQ Director Dan Wyant's official approval.

There's been some debate over whether Flint should have had corrosion control in place the entire time.

MDEQ officials have argued to the U.S. Environmental Protection Agency that corrosion control is not technically required yet, because the Flint River is a new water source.

“You have to have to do a full year of studying” the water chemistry as it behaves across the system before implementing corrosion control, MDEQ spokesman Brad Wurfel said. He says that’s the only way to know what corrosion-control treatment to use.

That period of study was to be completed by June 30.

As the DEQ reads federal regulations, Flint technically has up to two years after the study to install treatment. But Wurfel says an announcement on the state's decision will come by the end of this week, and "the prescription for optimizing the system for corrosion control is going to be done in Flint by the end of this year."

"We have a plan to expedite this with the city ... and folks can take some comfort in that," Wurfel said.

It's not clear yet how much the treatment will cost, but Wurfel says "this won't break the bank." A state-appointed emergency manager made the interim switch to the Flint River to save the city money.

The U.S. Environmental Protection Agency has not yet answered this question: Was Flint required to have some form of corrosion-control treatment the whole time?

At face value, the EPA rules are clear, all water systems that serve more than 50,000 people must have some kind of corrosion control.

But when you switch water sources, there is apparently some room for interpretation.

In approving updates to this federal regulation in 2000, the EPA noted that “water systems need to make treatment changes, on occasion, to react to changing circumstances.”

In these cases, the rule does not “prevent a state from approving treatment changes,” but it’s not entirely clear if the state can approve having zero corrosion-control treatment.

One key section of the rule change reads:

“One commenter requested that EPA clarify in the rule language that (large water) systems are not required to have (corrosion-control treatment) physically present. EPA disagrees that this is appropriate.”

“For large water systems, (the federal rule) does not eliminate the need to have any (corrosion-control treatment) in place, unless the water system can demonstrate to the satisfaction of the State that such treatment will have no effect on reducing the levels of lead and copper at the tap … EPA expects few, if any, large water systems can make this demonstration without (corrosion-control treatment).”

Flint residents can be sure about one thing: This period of study and approval won’t happen the next time the city switches water sources.

The city expects to stop using the Flint River when a new regional water system in Genesee County is completed, slated for the end of 2016. According the MDEQ’s Brad Wurfel, that’s because they won’t need to study the nature of the new water source – Lake Huron. Because Detroit’s water system uses water from Lake Huron, Flint will be able to use the same corrosion-control treatment it did when it was hooked up to Detroit’s system.

http://michiganradio.org/post/have-you-missed-parts-flint-water-story-heres-quick-rundown#stream/0

Have you missed parts of the Flint water story? Here's a quick rundown.

Michigan Radio Newsroom • Sep 25, 2015

Flint switched its drinking water source in April of 2014. The city went from Detroit water to water from the Flint River, and there have been problems ever since.

Most recently, residents have been enraged to hear about elevated lead levels in kids. At this point, Flint residents have been unsure about the safety of their water for over a year.

Here's a quick rundown of the problems some Flint residents have been complaining about.

Discoloration and smell

Water issues started right after the switch as residents complained that the new water smelled and tasted different. City officials issued boil water advisories but insisted this was not connected to the switch.

E. coli

Tests of Flint water showed high levels of bacteria, including E. coli. Residents were issued a number of boil water notices.

Chlorine

To address the increased E. coli levels, the city pumped more chlorine into the system as a disinfectant.

TTHM

In January of 2015, residents received warnings that their water didn't meet federal safety standards because tests were showing higher rates of total trihalomethane. TTHM is a byproduct of the chlorine that had been used to address earlier problems. Too much TTHM increases the risk of cancer. Average TTHM levels did not fall to acceptable levels againuntil late this summer.

Lead

In January 2015, the University of Michigan-Flint conducted tests of its own water. Some of their samples contained "high levels of lead." At that time, researchers said the lead levels were high in those samples because the water was spending a lot of time sitting in old pipes.

Activists started asking for courts to force the city to go back to Detroit water in April. Those requests fell short.

An EPA memo leaked in July documented "extremely high levels at one woman's home, high enough that her son got lead poisoning."

Researchers from Virginia Tech tested samples from nearly 300 Flint homes in September. Their findings showed 'seriously' high levels of lead.

On September 24, Flint pediatricians announced their findings that the percentage of Flint children with elevated blood levels has almost doubled since the water source switch.

Subject: Fwd: Flint water clips for the morning of Sept. 30

Please pay close attention to the first clip -- which aired on NPR last night. The MDEQ spokesman's reference to an EPA "rogue employee" is something that we are going to need to address -- both with MDEQ and the public. As I understand it, this employee had been asked to prepare a memo on with the Flint water system to update R5 Water Division management on the situation in Flint -- and he shared a draft internal memo with Citizen name / Ex. 6 to get her OK to include data about her child's lead levels (and she subsequently gave the draft to the ACLU.) While EPA employees should not be sharing internal draft documents with the public -- I think he was well-intentioned and I don't think he should be publicly branded as a "rogue employee." Moreover, many of the recommendations in the draft memo are the very steps that MDEQ and the City are now taking to address the lead problem. When we talk later today, I'd like some advice on how best to address this.

High Lead Levels In Michigan Kids After City Switches Water Source

NPR All Things Considered

September 29, 2015 6:01 PM ET

Doctors are finding elevated levels of lead in the children in Flint, Mich., and local tap water is the likely cause.

That's the latest alarming news to come out of the city, which switched its water source about a year and a half ago.

A pediatrician with Hurley Medical Center analyzed lead levels of hundreds of children. She compared blood tests before and after April 2014. That's when Flint, unable to come to an agreement on a short-term contract with Detroit, quit buying water from its system, and signed on with a new system that will draw water from Lake Huron.

But that system won't be online until next year. So in the interim, with assurances from the state that it would be safe, the city decided to pump water from the Flint River.

Dr. Mona Hanna-Attisha's research found that the percentage of Flint children 5 years and younger with elevated lead levels nearly doubled after the switch, from 2.1 percent to 4 percent.

"My research shows that lead levels have gone up," Hanna-Attisha says. "I cannot say it's from the water. But that's, you know, the thing that has happened."

A Cascade Of Problems

The news did not surprise Lee Anne Walters. She suspected the water had something to do with health problems in her 4-year-old son, Gavin.

"I kept talking to the doctors, trying to figure out why he wasn't growing," she says. "He was 27 pounds at 4 years old. His hair was thinning, breaking out in rashes."

Complaints about foul-smelling, discolored water began soon after the city started drawing water from the Flint River. In the summer of 2014, the city issued a notice for residents to boil their water because of E. coli contamination.

Then the city was found to be in violation of the Safe Drinking Water Act because of high levels of a disinfectant byproduct called total trihalomethanes — an unintended consequence from all the chlorine the city had to use to kill the E. coli.

Walters says her whole family broke out in rashes, and they stopped drinking the water in December.

Then, in February of this year, the city tested her water for lead.

"And I got a frantic phone call from the water department telling me to please make sure my kids didn't drink the water, don't mix their juice with it, because they had never seen a number that high for lead," she says.

After that, Walters decided to take Gavin in to be tested for lead.

He'd been tested before the city switched its water source. At that time, he had a level of 2 micrograms of lead per deciliter of blood. After the switch, his level was 6.5.

The Centers for Disease Control and Prevention says a level of 5 is considered "much higher" than that found in most children. It also says there is no safe level of lead exposure — and the effects, like lower IQ, are irreversible.

A Failure Of Government?

The day after Hanna-Attisha released her findings, the city put out a lead advisory, urging people to flush their pipes, install inexpensive filters, and use cold water for mixing baby formula.

"As a father, I want every family and household in the city of Flint to be safe and secure," Mayor Dayne Walling said at a press conference to announce the advisory.

Over the summer, researchers from Virginia Tech found that Flint River water is highly corrosive. That means when it comes into contact with lead from service lines, household pipes or solder, it eats away at the lead and sends it right to people's faucets.

City officials and state regulators say they're now putting together a corrosion control plan to reduce lead exposure.

"Flint is the only city in America that I'm aware of that does not have a corrosion control plan," said Virginia Tech's Marc Edwards, who led the research.

Edwards also uncovered lead contamination in Washington, D.C. He says Flint's lead levels are not as high, and the exposure period is not as long as it was in that city. But he has some harsh criticism of city and state officials for how they've handled the Flint situation.

"It was clearly a failure of government agencies to do their job to protect the public," says Edwards, citing the absence of a corrosion control plan from the outset.

A draft report from the EPA that was obtained by the ACLU of Michigan also takes the city and state to task.

"Prior to April 30, 2014, the City of Flint purchased finished water from the City of Detroit which contained orthophosphate, a treatment chemical used to control lead and copper levels in the drinking water," the report read, adding that the treatment was discontinued after the switch to Flint River water.

"In accordance with the Lead and Copper Rule (LCR), all large systems ... are required to install and maintain corrosion control treatment for lead and copper. In the absence of any corrosion control treatment, lead levels in drinking water can be expected to increase," the report continued.

A Solution May Be Near

But officials with the Michigan Department of Environmental Quality dispute the findings of the draft report. MDEQ spokesman Brad Wurfel says the report was the work of a "rogue employee," and promised the final report — not yet released — would tell a much different story.

"You have to have to do a full year of studying" the water chemistry as it behaves across the system before implementing corrosion control, Wurfel says, adding that's the only way to know how much phosphate to add to the water.

An announcement about the corrosion control plan is expected soon. Meanwhile, city officials are showing increasing interest in returning to Detroit's water system — something that even a few days ago they dismissed as economically unfeasible for the cash-strapped city.

Whatever the solution, residents like Lee Anne Walters say they hope the city can reach one soon.

"I want them to take responsibility," Walters says. "I want them to quit poisoning their citizens."

http://www.detroitnews.com/story/news/politics/2015/09/29/govs-office-helps-get-water-filters-flint-families/73055442/

Gov's office helps get water filters to Flint families

Chad Livengood, Detroit News Lansing Bureau 6:30 p.m. EDT September 29, 2015

Gov. Rick Snyder's office quietly orchestrated the distribution of 1,500 water filters to Flint families this summer while insisting the city's water is safe to drink.

In July, Snyder's office worked with an anonymous corporate donor to distribute the faucet filters through a group of Flint pastors, Snyder spokesman Dave Murray said Tuesday. It was unclear who initiated the plan — the donor, the governor's office or someone else.

"We worked with the pastors' group to distribute the filters and asked that members respect the donor's wishes not to be identified," Murray said. "We told the group that we're not looking for credit and appreciated the pastors' efforts in working with the community on this effort."

Snyder's office acknowledged its role Tuesday in handing out the free filters to Flint residents while pressure is mounting on state agencies to fix Flint's troubled water system. A study last week showed elevated levels of lead in the blood of Flint children younger than 5.

“People have complained about the color and the odor, and faucet filters will help with those challenges as well as improving water quality overall,” Murray said.

The governor’s office is in discussions with “a number of groups that are interested” in distributing more faucet filters, Murray said.

The water filters can remove chemical compounds as well as lead, a toxic metal that can hinder brain development in young children even at low levels, according to the U.S. Environmental Protection Agency.

Flint residents began complaining about the taste and color of the city’s water in April 2014 when the city halted a half-century of purchasing water from the Detroit Water and Sewerage Department and started pumping drinking water from the Flint River.

River water is a trickier source for municipal cleaning and distribution than Lake Huron, where the Detroit system gets its water. The deeper, still waters of the lake contain few of the organic materials found in river water and require a different treatment protocol.

The Flint River is serving as a temporary water source until the city can connect to a new regional water pipeline from Lake Huron that won’t be ready until late 2016.

A year ago, General Motors’ Flint Engine Operations plant stopped using the city’s river because of concerns about corrosive effects and now gets its water from Flint Township.

Last week, pediatricians at Hurley Medical Center released a study of blood levels of Flint children younger than 5 between January 2013 and September 2013 when Flint used Detroit’s water and January and September of this year when residents drank Flint River water.

But Flint's water tested below the federal limit for lead in the Michigan Department of Environmental Quality's 2014 testing, DEQ spokesman Brad Wurfel said Tuesday.

Still, the state agency is working closely to address a "crisis of confidence" among Flint residents, Wurfel said. "Even though it is meeting standards, there is a significant concern in the city of Flint," he said.

Senate Minority Leader Jim Ananich, D-Flint, has urged Snyder to seek emergency funding to distribute faucet filters to about 15,000 Flint homes.

Ananich also wants the governor to get Flint reconnected to Detroit's water system.

In January, the Detroit water system offered to reconnect water service to Flint because of the complaints. Flint officials rebuffed the offer, saying an analysis concluded it would cost Flint an additional $12 million per year or more.

Snyder has been non-committal to Ananich's proposals, but said Tuesday his administration will be taking action soon.

"I have a large team of people working on the Flint water issue as we speak," Snyder said after an event in Lansing. "What I would say is during the course of the week or early next week, hopefully we'll be coming out with more public action steps ... and more action steps to take in the future.

"I take it as a serious issue, the Flint water situation. Lead's a serious issue, so we're spending a lot of time and effort looking at that and trying to partner with the people in Flint on that issue."

Flint mayor to state: Approve plan “as fast as humanly possible” to help keep lead out of water

Lindsey Smith , Michigan Radio • 14 hours ago

Flint hasn’t been using any corrosion-control method since it switched from Detroit’s water system in April 2014. Corrosion-control treatment helps keep lead out of drinking water. Since the switch, more kids are showing up with elevated levels of lead in their blood.

Flint Mayor Dayne Walling says he wants to put corrosion-control treatment back in place, but he needs state approval first. The state says it’s going to take a little while to implement.

“One of my requests to (Michigan’s) Department of Environmental Quality director is that (approval) be accelerated as fast as humanly possible,” Walling said.

“Whatever decisions are coming next, we need that corrosion control in the water treatment process that we have now,” he said.

Walling was a guest today on Stateside with Cynthia Canty. (Listen to Flint Mayor Dayne Walling on Stateside: http://cpa.ds.npr.org/michigan/audio/2015/09/20150929-SS-FLINT-WATER.mp3)

Flint spokesman Jason Lorenz says MDEQ made the recommendation to put corrosion-control treatment into the water supply last month. But, he says, it needs MDEQ Director Dan Wyant's official approval.

There's been some debate over whether Flint should have had corrosion control in place the entire time.

MDEQ officials have argued to the U.S. Environmental Protection Agency that corrosion control is not technically required yet, because the Flint River is a new water source.

"You have to have to do a full year of studying" the water chemistry as it behaves across the system before implementing corrosion control, MDEQ spokesman Brad Wurfel said. He says that's the only way to know what corrosion-control treatment to use.

That period of study was to be completed by June 30.

As the DEQ reads federal regulations, Flint technically has up to two years after the study to install treatment. But Wurfel says an announcement on the state's decision will come by the end of this week, and "the prescription for optimizing the system for corrosion control is going to be done in Flint by the end of this year."

"We have a plan to expedite this with the city ... and folks can take some comfort in that," Wurfel said.

It's not clear yet how much the treatment will cost, but Wurfel says "this won't break the bank." A state-appointed emergency manager made the interim switch to the Flint River to save the city money.

The U.S. Environmental Protection Agency has not yet answered this question: Was Flint required to have some form of corrosion-control treatment the whole time?

At face value, the EPA rules are clear, all water systems that serve more than 50,000 people must have some kind of corrosion control.

But when you switch water sources, there is apparently some room for interpretation.

In approving updates to this federal regulation in 2000, the EPA noted that "water systems need to make treatment changes, on occasion, to react to changing circumstances."

In these cases, the rule does not "prevent a state from approving treatment changes," but it's not entirely clear if the state can approve having zero corrosion-control treatment.

One key section of the rule change reads:

"One commenter requested that EPA clarify in the rule language that (large water) systems are not required to have (corrosion-control treatment) physically present. EPA disagrees that this is appropriate."

"For large water systems, (the federal rule) does not eliminate the need to have any (corrosion-control treatment) in place, unless the water system can demonstrate to the satisfaction of the State that such treatment will have no effect on reducing the levels of lead and copper at the tap … EPA expects few, if any, large water systems can make this demonstration without (corrosion-control treatment)."

Flint residents can be sure about one thing: This period of study and approval won't happen the next time the city switches water sources.

The city expects to stop using the Flint River when a new regional water system in Genesee County is completed, slated for the end of 2016. According the MDEQ's Brad Wurfel, that's because they won't need to study the nature of the new water source – Lake Huron. Because Detroit's water system uses water from Lake Huron, Flint will be able to use the same corrosion-control treatment it did when it was hooked up to Detroit's system.

Have you missed parts of the Flint water story? Here's a quick rundown.

Michigan Radio Newsroom • Sep 25, 2015

Flint switched its drinking water source in April of 2014. The city went from Detroit water to water from the Flint River, and there have been problems ever since.

Most recently, residents have been enraged to hear about elevated lead levels in kids. At this point, Flint residents have been unsure about the safety of their water for over a year.

Here's a quick rundown of the problems some Flint residents have been complaining about.

Discoloration and smell

Water issues started right after the switch as residents complained that the new water smelled and tasted different. City officials issued boil water advisories but insisted this was not connected to the switch.

E. coli

Tests of Flint water showed high levels of bacteria, including E. coli. Residents were issued a number of boil water notices.

Chlorine

To address the increased E. coli levels, the city pumped more chlorine into the system as a disinfectant.

TTHM

In January of 2015, residents received warnings that their water didn't meet federal safety standards because tests were showing higher rates of total trihalomethane. TTHM is a byproduct of the chlorine that had been used to address earlier problems. Too much TTHM increases the risk of cancer. Average TTHM levels did not fall to acceptable levels againuntil late this summer.

Lead

In January 2015, the University of Michigan-Flint conducted tests of its own water. Some of their samples contained "high levels of lead." At that time, researchers said the lead levels were high in those samples because the water was spending a lot of time sitting in old pipes.

Activists started asking for courts to force the city to go back to Detroit water in April. Those requests fell short.

An EPA memo leaked in July documented "extremely high levels at one woman's home, high enough that her son got lead poisoning."

Researchers from Virginia Tech tested samples from nearly 300 Flint homes in September. Their findings showed 'seriously' high levels of lead.

On September 24, Flint pediatricians announced their findings that the percentage of Flint children with elevated blood levels has almost doubled since the water source switch.

Carole

We should be clear that EPA has not asked ATSDR to review the blood lead data for the City of Flint. The State of Michigan is the lead for investigation and communication with the Flint situation. The reason we had made an inquiry regarding the All Ages Lead Model (AALM) was to test its accuracy in predicting blood lead levels. Since there is both water data and blood lead data for the same population, we were considering using the AALM to determine how well the predicted levels compared to the actual measured levels.

Apparently is not easy to arrange for the installation of the software to run the All Ages Lead Model, which is still being beta tested. The site license for the ACSL is held in ORD by Paul Schlosser. In anticipation that the regions may ultimately be using the AALM, EPA-R5 may want to consider contacting ORD to serve as a beta tester for the software.

Subject: Help with the All Ages Lead Model?

Hi Carole,

We are writing to ask for some help with something. I'm not sure if you are keeping up with what's been happening in Flint, MI with the increasing water lead levels due to a switch in water source for the town? Our Michigan State Health Dept partners are going through a bit of a snag because the Lead Program folks initially ran a comparison of pre- and post- water source switch blood lead levels in children ages 0-16 and reported no significant increase in the proportion of elevated BLs. However, folks at the Hurley Medical Center (where many blood leads are analyzed) ran their own comparisons restricting to high water lead zip codes in Flint, and looking first at children 0-5, then at babies < 15 months and found a significant doubling of the % >5 ug/L (attached is a scanned page of some of their results – excuse my scribble – I ran my own test of proportions to verify the p-value). The water lead levels are about 11 now – not yet at 15 but perhaps rising. The issue has become quite political and it seems USEPA will be pulled in somehow.

We'd like to provide our State Health partners with some support. Mark wanted to plug in some of the site-specific parameters into the IEUBK model, and do the same with the new All Ages Lead Model (since the whole population of Flint is affected by this). We've inquired about obtaining a copy of the that program, but it seems you also need a program called ACSL to run the AALM, and we do not have an ACSL license (please see below). EPA has a corporate license, and the AAML is currently being beta tested. Is there any possibility that one of the R5 EPA risk assessors is already beta testing this program, or would be willing to load it so we could use it in support of the lead issue in Flint?

Thank you,

Claudine

P.S. Thanks again for correcting my last name on the Epi talk announcement!

Subject: RE: Access to All Ages Model

Hi Mark,

Glad you talked with Jim – he's a great guy. I like him very much!

In order to run the AALM you do need acsl. (www.acslx.com). The trouble here will be cost. It cost several hundred dollars per license; however, at EPA we had a corporate license so we could install on as many computers as we wanted, but only a certain few would have tech support. If AALM becomes the mainstream at ATSDR, we'd definitely be better off going that way.

Is there something you were thinking of doing with the AALM that I could help you with? Are you interested in joining our AALM validation team, etc.?

V/r,

Eva

Wurfel says to NPR you have to poison kids for a year before implementing corrosion control, and to determine the right orthophosphate dose?

Eric, is this going to be part of the new improved LCR? And is EPA going to hand Miguel's draft memo to Wurfel, to finalize and/or approve? Wurfel PROMISES THAT the final memo is going to tell a different story. And Miguel is now a ROGUE EPA employee?

EPA Office of Water and EPA Region 5 are a national embarrassment. You have a city in crisis, kids with elevated blood lead, and NO CORROSION CONTROL PLAN FOR 16 MONTHS, and yet you sit there and do absolutely nothing.

Marc

http://www.npr.org/2015/09/29/444497051/high-lead-levels-in-michigan-kids-after-city-switches-water-source

A draft report from the EPA that was obtained by the ACLU of Michigan also takes the city and state to task.

"Prior to April 30, 2014, the City of Flint purchased finished water from the City of Detroit which contained orthophosphate, a treatment chemical used to control lead and copper levels in the drinking water," the report read, adding that the treatment was discontinued after the switch to Flint River water.

"In accordance with the Lead and Copper Rule (LCR), all large systems ... are required to install and maintain corrosion control treatment for lead and copper. In the absence of any corrosion control treatment, lead levels in drinking water can be expected to increase," the report continued.

A Solution May Be Near

But officials with the Michigan Department of Environmental Quality dispute the findings of the draft report. MDEQ spokesman Brad Wurfel says the report was the work of a "rogue employee," and promised the final report — not yet released — would tell a much different story.

"You have to have to do a full year of studying" the water chemistry as it behaves across the system before implementing corrosion control, Wurfel says, adding that's the only way to know how much phosphate to add to the water.

Please pay close attention to the first clip -- which aired on NPR last night. The MDEQ spokesman's reference to an EPA "rogue employee" is something that we are going to need to address -- both with MDEQ and the public. As I understand it, this employee had been asked to prepare a memo on with the Flint water system to update R5 Water Division management on the situation in Flint -- and he shared a draft internal memo with Citizen name / Ex. 6 o get her OK to include data about her child's lead levels (and she subsequently gave the draft to the ACLU.) While EPA employees should not be sharing internal draft documents with the public -- I think he was well-intentioned and I don't think he should be publicly branded as a "rogue employee." Moreover, many of the recommendations in the draft memo are the very steps that MDEQ and the City are now taking to address the lead problem. When we talk later today, I'd like some advice on how best to address this.

High Lead Levels In Michigan Kids After City Switches Water Source

NPR All Things Considered

September 29, 2015 6:01 PM ET

Doctors are finding elevated levels of lead in the children in Flint, Mich., and local tap water is the likely cause.

That's the latest alarming news to come out of the city, which switched its water source about a year and a half ago.

A pediatrician with Hurley Medical Center analyzed lead levels of hundreds of children. She compared blood tests before and after April 2014. That's when Flint, unable to come to an agreement on a short-term contract with Detroit, quit buying water from its system, and signed on with a new system that will draw water from Lake Huron.

But that system won't be online until next year. So in the interim, with assurances from the state that it would be safe, the city decided to pump water from the Flint River.

Dr. Mona Hanna-Attisha's research found that the percentage of Flint children 5 years and younger with elevated lead levels nearly doubled after the switch, from 2.1 percent to 4 percent.

"My research shows that lead levels have gone up," Hanna-Attisha says. "I cannot say it's from the water. But that's, you know, the thing that has happened."

A Cascade Of Problems

The news did not surprise Lee Anne Walters. She suspected the water had something to do with health problems in her 4-year-old son, Gavin.

"I kept talking to the doctors, trying to figure out why he wasn't growing," she says. "He was 27 pounds at 4 years old. His hair was thinning, breaking out in rashes."

Complaints about foul-smelling, discolored water began soon after the city started drawing water from the Flint River. In the summer of 2014, the city issued a notice for residents to boil their water because of E. coli contamination.

Then the city was found to be in violation of the Safe Drinking Water Act because of high levels of a disinfectant byproduct called total trihalomethanes — an unintended consequence from all the chlorine the city had to use to kill the E. coli.

Walters says her whole family broke out in rashes, and they stopped drinking the water in December.

Then, in February of this year, the city tested her water for lead.

"And I got a frantic phone call from the water department telling me to please make sure my kids didn't drink the water, don't mix their juice with it, because they had never seen a number that high for lead," she says.

After that, Walters decided to take Gavin in to be tested for lead.

He'd been tested before the city switched its water source. At that time, he had a level of 2 micrograms of lead per deciliter of blood. After the switch, his level was 6.5.

The Centers for Disease Control and Prevention says a level of 5 is considered "much higher" than that found in most children. It also says there is no safe level of lead exposure — and the effects, like lower IQ, are irreversible.

A Failure Of Government?

The day after Hanna-Attisha released her findings, the city put out a lead advisory, urging people to flush their pipes, install inexpensive filters, and use cold water for mixing baby formula.

"As a father, I want every family and household in the city of Flint to be safe and secure," Mayor Dayne Walling said at a press conference to announce the advisory.

Over the summer, researchers from Virginia Tech found that Flint River water is highly corrosive. That means when it comes into contact with lead from service lines, household pipes or solder, it eats away at the lead and sends it right to people's faucets.

City officials and state regulators say they're now putting together a corrosion control plan to reduce lead exposure.

"Flint is the only city in America that I'm aware of that does not have a corrosion control plan," said Virginia Tech's Marc Edwards, who led the research.

Edwards also uncovered lead contamination in Washington, D.C. He says Flint's lead levels are not as high, and the exposure period is not as long as it was in that city. But he has some harsh criticism of city and state officials for how they've handled the Flint situation.

"It was clearly a failure of government agencies to do their job to protect the public," says Edwards, citing the absence of a corrosion control plan from the outset.

A draft report from the EPA that was obtained by the ACLU of Michigan also takes the city and state to task.

"Prior to April 30, 2014, the City of Flint purchased finished water from the City of Detroit which contained orthophosphate, a treatment chemical used to control lead and copper levels in the drinking water," the report read, adding that the treatment was discontinued after the switch to Flint River water.

"In accordance with the Lead and Copper Rule (LCR), all large systems ... are required to install and maintain corrosion control treatment for lead and copper. In the absence of any corrosion control treatment, lead levels in drinking water can be expected to increase," the report continued.

A Solution May Be Near

But officials with the Michigan Department of Environmental Quality dispute the findings of the draft report. MDEQ spokesman Brad Wurfel says the report was the work of a "rogue employee," and promised the final report — not yet released — would tell a much different story.

"You have to have to do a full year of studying" the water chemistry as it behaves across the system before implementing corrosion control, Wurfel says, adding that's the only way to know how much phosphate to add to the water.

An announcement about the corrosion control plan is expected soon. Meanwhile, city officials are showing increasing interest in returning to Detroit's water system — something that even a few days ago they dismissed as economically unfeasible for the cash-strapped city.

Whatever the solution, residents like Lee Anne Walters say they hope the city can reach one soon.

"I want them to take responsibility," Walters says. "I want them to quit poisoning their citizens."

Report: Using Flint River proving costly to city's water system

Steve Carmody, Michigan Radio • 28 minutes ago

A new report (http://flintwaterstudy.org/) estimates it will cost the city of Flint $1.5 billion to repair the damage done since the switch to the Flint River as a water source.

Researchers from Virginia Tech based their estimate on the tests of the corrosiveness of the Flint River.

The researchers say the corrosiveness is “eating away” lead pipes, aging the system by more than 11.5 years in just the last 16 months.

City and state leaders are talking about taking steps to fix Flint’s water problems.

One option on the table might be returning to Detroit water. But Flint will probably need help from the state to do that.

---

http://www.detroitnews.com/story/news/politics/2015/09/29/govs-office-helps-get-water-filters-flint-families/73055442/

Gov’s office helps get water filters to Flint families

Chad Livengood, Detroit News Lansing Bureau 6:30 p.m. EDT September 29, 2015

Gov. Rick Snyder’s office quietly orchestrated the distribution of 1,500 water filters to Flint families this summer while insisting the city’s water is safe to drink.

In July, Snyder’s office worked with an anonymous corporate donor to distribute the faucet filters through a group of Flint pastors, Snyder spokesman Dave Murray said Tuesday. It was unclear who initiated the plan — the donor, the governor’s office or someone else.

“We worked with the pastors’ group to distribute the filters and asked that members respect the donor’s wishes not to be identified,” Murray said. “We told the group that we're not looking for credit and appreciated the pastors' efforts in working with the community on this effort."

Snyder's office acknowledged its role Tuesday in handing out the free filters to Flint residents while pressure is mounting on state agencies to fix Flint's troubled water system. A study last week showed elevated levels of lead in the blood of Flint children younger than 5.

"People have complained about the color and the odor, and faucet filters will help with those challenges as well as improving water quality overall," Murray said.

The governor's office is in discussions with "a number of groups that are interested" in distributing more faucet filters, Murray said.

The water filters can remove chemical compounds as well as lead, a toxic metal that can hinder brain development in young children even at low levels, according to the U.S. Environmental Protection Agency.

Flint residents began complaining about the taste and color of the city's water in April 2014 when the city halted a half-century of purchasing water from the Detroit Water and Sewerage Department and started pumping drinking water from the Flint River.

River water is a trickier source for municipal cleaning and distribution than Lake Huron, where the Detroit system gets its water. The deeper, still waters of the lake contain few of the organic materials found in river water and require a different treatment protocol.

The Flint River is serving as a temporary water source until the city can connect to a new regional water pipeline from Lake Huron that won't be ready until late 2016.

A year ago, General Motors' Flint Engine Operations plant stopped using the city's river because of concerns about corrosive effects and now gets its water from Flint Township.

Last week, pediatricians at Hurley Medical Center released a study of blood levels of Flint children younger than 5 between January 2013 and September 2013 when Flint used Detroit's water and January and September of this year when residents drank Flint River water.

But Flint's water tested below the federal limit for lead in the Michigan Department of Environmental Quality's 2014 testing, DEQ spokesman Brad Wurfel said Tuesday.

Still, the state agency is working closely to address a "crisis of confidence" among Flint residents, Wurfel said. "Even though it is meeting standards, there is a significant concern in the city of Flint," he said.

Senate Minority Leader Jim Ananich, D-Flint, has urged Snyder to seek emergency funding to distribute faucet filters to about 15,000 Flint homes.

Ananich also wants the governor to get Flint reconnected to Detroit's water system.

In January, the Detroit water system offered to reconnect water service to Flint because of the complaints. Flint officials rebuffed the offer, saying an analysis concluded it would cost Flint an additional $12 million per year or more.

Snyder has been non-committal to Ananich's proposals, but said Tuesday his administration will be taking action soon.

"I have a large team of people working on the Flint water issue as we speak," Snyder said after an event in Lansing. "What I would say is during the course of the week or early next week, hopefully we'll be coming out with more public action steps ... and more action steps to take in the future.

"I take it as a serious issue, the Flint water situation. Lead's a serious issue, so we're spending a lot of time and effort looking at that and trying to partner with the people in Flint on that issue."

Flint mayor to state: Approve plan "as fast as humanly possible" to help keep lead out of water

Lindsey Smith , Michigan Radio • 14 hours ago

Flint hasn't been using any corrosion-control method since it switched from Detroit's water system in April 2014. Corrosion-control treatment helps keep lead out of drinking water. Since the switch, more kids are showing up with elevated levels of lead in their blood.

Flint Mayor Dayne Walling says he wants to put corrosion-control treatment back in place, but he needs state approval first. The state says it's going to take a little while to implement.

"One of my requests to (Michigan's) Department of Environmental Quality director is that (approval) be accelerated as fast as humanly possible," Walling said.

“Whatever decisions are coming next, we need that corrosion control in the water treatment process that we have now,” he said.

Walling was a guest today on Stateside with Cynthia Canty. (Listen to Flint Mayor Dayne Walling on Stateside: http://cpa.ds.npr.org/michigan/audio/2015/09/20150929-SS-FLINT-WATER.mp3)

Flint spokesman Jason Lorenz says MDEQ made the recommendation to put corrosion-control treatment into the water supply last month. But, he says, it needs MDEQ Director Dan Wyant’s official approval.

There’s been some debate over whether Flint should have had corrosion control in place the entire time.

MDEQ officials have argued to the U.S. Environmental Protection Agency that corrosion control is not technically required yet, because the Flint River is a new water source.

“You have to have to do a full year of studying” the water chemistry as it behaves across the system before implementing corrosion control, MDEQ spokesman Brad Wurfel said. He says that’s the only way to know what corrosion-control treatment to use.

That period of study was to be completed by June 30.

As the DEQ reads federal regulations, Flint technically has up to two years after the study to install treatment. But Wurfel says an announcement on the state's decision will come by the end of this week, and "the prescription for optimizing the system for corrosion control is going to be done in Flint by the end of this year."

"We have a plan to expedite this with the city ... and folks can take some comfort in that," Wurfel said.

It's not clear yet how much the treatment will cost, but Wurfel says "this won't break the bank." A state-appointed emergency manager made the interim switch to the Flint River to save the city money.

The U.S. Environmental Protection Agency has not yet answered this question: Was Flint required to have some form of corrosion-control treatment the whole time?

At face value, the EPA rules are clear, all water systems that serve more than 50,000 people must have some kind of corrosion control.

But when you switch water sources, there is apparently some room for interpretation.

In approving updates to this federal regulation in 2000, the EPA noted that "water systems need to make treatment changes, on occasion, to react to changing circumstances."

In these cases, the rule does not "prevent a state from approving treatment changes," but it's not entirely clear if the state can approve having zero corrosion-control treatment.

One key section of the rule change reads:

"One commenter requested that EPA clarify in the rule language that (large water) systems are not required to have (corrosion-control treatment) physically present. EPA disagrees that this is appropriate."

“For large water systems, (the federal rule) does not eliminate the need to have any (corrosion-control treatment) in place, unless the water system can demonstrate to the satisfaction of the State that such treatment will have no effect on reducing the levels of lead and copper at the tap … EPA expects few, if any, large water systems can make this demonstration without (corrosion-control treatment).”

Flint residents can be sure about one thing: This period of study and approval won’t happen the next time the city switches water sources.

The city expects to stop using the Flint River when a new regional water system in Genesee County is completed, slated for the end of 2016. According the MDEQ’s Brad Wurfel, that’s because they won’t need to study the nature of the new water source – Lake Huron. Because Detroit’s water system uses water from Lake Huron, Flint will be able to use the same corrosion-control treatment it did when it was hooked up to Detroit’s system.

---

Have you missed parts of the Flint water story? Here's a quick rundown.

Michigan Radio Newsroom • Sep 25, 2015

Flint switched its drinking water source in April of 2014. The city went from Detroit water to water from the Flint River, and there have been problems ever since.

Most recently, residents have been enraged to hear about elevated lead levels in kids. At this point, Flint residents have been unsure about the safety of their water for over a year.

Here's a quick rundown of the problems some Flint residents have been complaining about.

Discoloration and smell

Water issues started right after the switch as residents complained that the new water smelled and tasted different. City officials issued boil water advisories but insisted this was not connected to the switch.

E. coli

Tests of Flint water showed high levels of bacteria, including E. coli. Residents were issued a number of boil water notices.

Chlorine

To address the increased E. coli levels, the city pumped more chlorine into the system as a disinfectant.

TTHM

In January of 2015, residents received warnings that their water didn't meet federal safety standards because tests were showing higher rates of total trihalomethane. TTHM is a byproduct of the chlorine that had been used to address earlier problems. Too much TTHM increases the risk of cancer. Average TTHM levels did not fall to acceptable levels againuntil late this summer.

Lead

In January 2015, the University of Michigan-Flint conducted tests of its own water. Some of their samples contained "high levels of lead." At that time, researchers said the lead levels were high in those samples because the water was spending a lot of time sitting in old pipes.

Activists started asking for courts to force the city to go back to Detroit water in April. Those requests fell short.

An EPA memo leaked in July documented "extremely high levels at one woman's home, high enough that her son got lead poisoning."

Researchers from Virginia Tech tested samples from nearly 300 Flint homes in September. Their findings showed 'seriously' high levels of lead.

On September 24, Flint pediatricians announced their findings that the percentage of Flint children with elevated blood levels has almost doubled since the water source switch.

Please pay close attention to the first clip -- which aired on NPR last night. The MDEQ spokesman's reference to an EPA "rogue employee" is something that we are going to need to address -- both with MDEQ and the public. As I understand it, this employee had been asked to prepare a memo on with the Flint water system to update R5 Water Division management on the situation in Flint -- and he shared a draft internal memo with Citizen name / Ex. 6 to get her OK to include data about her child's lead levels (and she subsequently gave the draft to the ACLU.) While EPA employees should not be sharing internal draft documents with the public -- I think he was well-intentioned and I don't think he should be publicly branded as a "rogue employee." Moreover, many of the recommendations in the draft memo are the very steps that MDEQ and the City are now taking to address the lead problem. When we talk later today, I'd like some advice on how best to address this.

High Lead Levels In Michigan Kids After City Switches Water Source

NPR All Things Considered

September 29, 2015 6:01 PM ET

Doctors are finding elevated levels of lead in the children in Flint, Mich., and local tap water is the likely cause.

That's the latest alarming news to come out of the city, which switched its water source about a year and a half ago.

A pediatrician with Hurley Medical Center analyzed lead levels of hundreds of children. She compared blood tests before and after April 2014. That's when Flint, unable to come to an agreement on a short-term contract with Detroit, quit buying water from its system, and signed on with a new system that will draw water from Lake Huron.

But that system won't be online until next year. So in the interim, with assurances from the state that it would be safe, the city decided to pump water from the Flint River.

Dr. Mona Hanna-Attisha's research found that the percentage of Flint children 5 years and younger with elevated lead levels nearly doubled after the switch, from 2.1 percent to 4 percent.

"My research shows that lead levels have gone up," Hanna-Attisha says. "I cannot say it's from the water. But that's, you know, the thing that has happened."

A Cascade Of Problems

The news did not surprise Lee Anne Walters. She suspected the water had something to do with health problems in her 4-year-old son, Gavin.

"I kept talking to the doctors, trying to figure out why he wasn't growing," she says. "He was 27 pounds at 4 years old. His hair was thinning, breaking out in rashes."

Complaints about foul-smelling, discolored water began soon after the city started drawing water from the Flint River. In the summer of 2014, the city issued a notice for residents to boil their water because of E. coli contamination.

Then the city was found to be in violation of the Safe Drinking Water Act because of high levels of a disinfectant byproduct called total trihalomethanes — an unintended consequence from all the chlorine the city had to use to kill the E. coli.

Walters says her whole family broke out in rashes, and they stopped drinking the water in December.

Then, in February of this year, the city tested her water for lead.

"And I got a frantic phone call from the water department telling me to please make sure my kids didn't drink the water, don't mix their juice with it, because they had never seen a number that high for lead," she says.

After that, Walters decided to take Gavin in to be tested for lead.

He'd been tested before the city switched its water source. At that time, he had a level of 2 micrograms of lead per deciliter of blood. After the switch, his level was 6.5.

The Centers for Disease Control and Prevention says a level of 5 is considered "much higher" than that found in most children. It also says there is no safe level of lead exposure — and the effects, like lower IQ, are irreversible.

A Failure Of Government?

The day after Hanna-Attisha released her findings, the city put out a lead advisory, urging people to flush their pipes, install inexpensive filters, and use cold water for mixing baby formula.

"As a father, I want every family and household in the city of Flint to be safe and secure," Mayor Dayne Walling said at a press conference to announce the advisory.

Over the summer, researchers from Virginia Tech found that Flint River water is highly corrosive. That means when it comes into contact with lead from service lines, household pipes or solder, it eats away at the lead and sends it right to people's faucets.

City officials and state regulators say they're now putting together a corrosion control plan to reduce lead exposure.

"Flint is the only city in America that I'm aware of that does not have a corrosion control plan," said Virginia Tech's Marc Edwards, who led the research.

Edwards also uncovered lead contamination in Washington, D.C. He says Flint's lead levels are not as high, and the exposure period is not as long as it was in that city. But he has some harsh criticism of city and state officials for how they've handled the Flint situation.

"It was clearly a failure of government agencies to do their job to protect the public," says Edwards, citing the absence of a corrosion control plan from the outset.

A draft report from the EPA that was obtained by the ACLU of Michigan also takes the city and state to task.

"Prior to April 30, 2014, the City of Flint purchased finished water from the City of Detroit which contained orthophosphate, a treatment chemical used to control lead and copper levels in the drinking water," the report read, adding that the treatment was discontinued after the switch to Flint River water.

"In accordance with the Lead and Copper Rule (LCR), all large systems ... are required to install and maintain corrosion control treatment for lead and copper. In the absence of any corrosion control treatment, lead levels in drinking water can be expected to increase," the report continued.

A Solution May Be Near

But officials with the Michigan Department of Environmental Quality dispute the findings of the draft report. MDEQ spokesman Brad Wurfel says the report was the work of a "rogue employee," and promised the final report — not yet released — would tell a much different story.

"You have to have to do a full year of studying" the water chemistry as it behaves across the system before implementing corrosion control, Wurfel says, adding that's the only way to know how much phosphate to add to the water.

An announcement about the corrosion control plan is expected soon. Meanwhile, city officials are showing increasing interest in returning to Detroit's water system — something that even a few days ago they dismissed as economically unfeasible for the cash-strapped city.

Whatever the solution, residents like Lee Anne Walters say they hope the city can reach one soon.

"I want them to take responsibility," Walters says. "I want them to quit poisoning their citizens."

Report: Using Flint River proving costly to city's water system

Steve Carmody, Michigan Radio • 28 minutes ago

A new report (http://flintwaterstudy.org/) estimates it will cost the city of Flint $1.5 billion to repair the damage done since the switch to the Flint River as a water source.

Researchers from Virginia Tech based their estimate on the tests of the corrosiveness of the Flint River.

The researchers say the corrosiveness is “eating away” lead pipes, aging the system by more than 11.5 years in just the last 16 months.

City and state leaders are talking about taking steps to fix Flint’s water problems.

One option on the table might be returning to Detroit water. But Flint will probably need help from the state to do that.

http://www.detroitnews.com/story/news/politics/2015/09/29/govs-office-helps-get-water-filters-flint-families/73055442/

Gov’s office helps get water filters to Flint families

Chad Livengood, Detroit News Lansing Bureau 6:30 p.m. EDT September 29, 2015

Gov. Rick Snyder’s office quietly orchestrated the distribution of 1,500 water filters to Flint families this summer while insisting the city’s water is safe to drink.

In July, Snyder’s office worked with an anonymous corporate donor to distribute the faucet filters through a group of Flint pastors, Snyder spokesman Dave Murray said Tuesday. It was unclear who initiated the plan — the donor, the governor’s office or someone else.

“We worked with the pastors’ group to distribute the filters and asked that members respect the donor’s wishes not to be identified,” Murray said. “We told the group that we’re not looking for credit and appreciated the pastors’ efforts in working with the community on this effort.”

Snyder’s office acknowledged its role Tuesday in handing out the free filters to Flint residents while pressure is mounting on state agencies to fix Flint’s troubled water system. A study last week showed elevated levels of lead in the blood of Flint children younger than 5.

“People have complained about the color and the odor, and faucet filters will help with those challenges as well as improving water quality overall,” Murray said.

The governor’s office is in discussions with “a number of groups that are interested” in distributing more faucet filters, Murray said.

The water filters can remove chemical compounds as well as lead, a toxic metal that can hinder brain development in young children even at low levels, according to the U.S. Environmental Protection Agency.

Flint residents began complaining about the taste and color of the city’s water in April 2014 when the city halted a half-century of purchasing water from the Detroit Water and Sewerage Department and started pumping drinking water from the Flint River.

River water is a trickier source for municipal cleaning and distribution than Lake Huron, where the Detroit system gets its water. The deeper, still waters of the lake contain few of the organic materials found in river water and require a different treatment protocol.

The Flint River is serving as a temporary water source until the city can connect to a new regional water pipeline from Lake Huron that won’t be ready until late 2016.

A year ago, General Motors' Flint Engine Operations plant stopped using the city's river because of concerns about corrosive effects and now gets its water from Flint Township.

Last week, pediatricians at Hurley Medical Center released a study of blood levels of Flint children younger than 5 between January 2013 and September 2013 when Flint used Detroit's water and January and September of this year when residents drank Flint River water.

But Flint's water tested below the federal limit for lead in the Michigan Department of Environmental Quality's 2014 testing, DEQ spokesman Brad Wurfel said Tuesday.

Still, the state agency is working closely to address a "crisis of confidence" among Flint residents, Wurfel said. "Even though it is meeting standards, there is a significant concern in the city of Flint," he said.

Senate Minority Leader Jim Ananich, D-Flint, has urged Snyder to seek emergency funding to distribute faucet filters to about 15,000 Flint homes.

Ananich also wants the governor to get Flint reconnected to Detroit's water system.

In January, the Detroit water system offered to reconnect water service to Flint because of the complaints. Flint officials rebuffed the offer, saying an analysis concluded it would cost Flint an additional $12 million per year or more.

Snyder has been non-committal to Ananich's proposals, but said Tuesday his administration will be taking action soon.

“I have a large team of people working on the Flint water issue as we speak,” Snyder said after an event in Lansing. “What I would say is during the course of the week or early next week, hopefully we’ll be coming out with more public action steps ... and more action steps to take in the future.

“I take it as a serious issue, the Flint water situation. Lead’s a serious issue, so we’re spending a lot of time and effort looking at that and trying to partner with the people in Flint on that issue.”

Flint mayor to state: Approve plan “as fast as humanly possible” to help keep lead out of water

Lindsey Smith , Michigan Radio • 14 hours ago

Flint hasn’t been using any corrosion-control method since it switched from Detroit’s water system in April 2014. Corrosion-control treatment helps keep lead out of drinking water. Since the switch, more kids are showing up with elevated levels of lead in their blood.

Flint Mayor Dayne Walling says he wants to put corrosion-control treatment back in place, but he needs state approval first. The state says it’s going to take a little while to implement.

“One of my requests to (Michigan’s) Department of Environmental Quality director is that (approval) be accelerated as fast as humanly possible,” Walling said.

“Whatever decisions are coming next, we need that corrosion control in the water treatment process that we have now,” he said.

Walling was a guest today on Stateside with Cynthia Canty. (Listen to Flint Mayor Dayne Walling on Stateside: http://cpa.ds.npr.org/michigan/audio/2015/09/20150929-SS-FLINT-WATER.mp3)

Flint spokesman Jason Lorenz says MDEQ made the recommendation to put corrosion-control treatment into the water supply last month. But, he says, it needs MDEQ Director Dan Wyant’s official approval.

There’s been some debate over whether Flint should have had corrosion control in place the entire time.

MDEQ officials have argued to the U.S. Environmental Protection Agency that corrosion control is not technically required yet, because the Flint River is a new water source.

“You have to have to do a full year of studying” the water chemistry as it behaves across the system before implementing corrosion control, MDEQ spokesman Brad Wurfel said. He says that’s the only way to know what corrosion-control treatment to use.

That period of study was to be completed by June 30.

As the DEQ reads federal regulations, Flint technically has up to two years after the study to install treatment. But Wurfel says an announcement on the state's decision will come by the end of this week, and "the prescription for optimizing the system for corrosion control is going to be done in Flint by the end of this year."

"We have a plan to expedite this with the city ... and folks can take some comfort in that," Wurfel said.

It's not clear yet how much the treatment will cost, but Wurfel says "this won't break the bank." A state-appointed emergency manager made the interim switch to the Flint River to save the city money.

The U.S. Environmental Protection Agency has not yet answered this question: Was Flint required to have some form of corrosion-control treatment the whole time?

At face value, the EPA rules are clear, all water systems that serve more than 50,000 people must have some kind of corrosion control.

But when you switch water sources, there is apparently some room for interpretation.

In approving updates to this federal regulation in 2000, the EPA noted that “water systems need to make treatment changes, on occasion, to react to changing circumstances.”

In these cases, the rule does not “prevent a state from approving treatment changes,” but it’s not entirely clear if the state can approve having zero corrosion-control treatment.

One key section of the rule change reads:

“One commenter requested that EPA clarify in the rule language that (large water) systems are not required to have (corrosion-control treatment) physically present. EPA disagrees that this is appropriate.”

"For large water systems, (the federal rule) does not eliminate the need to have any (corrosion-control treatment) in place, unless the water system can demonstrate to the satisfaction of the State that such treatment will have no effect on reducing the levels of lead and copper at the tap … EPA expects few, if any, large water systems can make this demonstration without (corrosion-control treatment)."

Flint residents can be sure about one thing: This period of study and approval won't happen the next time the city switches water sources.

The city expects to stop using the Flint River when a new regional water system in Genesee County is completed, slated for the end of 2016. According the MDEQ's Brad Wurfel, that's because they won't need to study the nature of the new water source – Lake Huron. Because Detroit's water system uses water from Lake Huron, Flint will be able to use the same corrosion-control treatment it did when it was hooked up to Detroit's system.

Have you missed parts of the Flint water story? Here's a quick rundown.

Michigan Radio Newsroom • Sep 25, 2015

Flint switched its drinking water source in April of 2014. The city went from Detroit water to water from the Flint River, and there have been problems ever since.

Most recently, residents have been enraged to hear about elevated lead levels in kids. At this point, Flint residents have been unsure about the safety of their water for over a year.

Here's a quick rundown of the problems some Flint residents have been complaining about.

Discoloration and smell

Water issues started right after the switch as residents complained that the new water smelled and tasted different. City officials issued boil water advisories but insisted this was not connected to the switch.

E. coli

Tests of Flint water showed high levels of bacteria, including E. coli. Residents were issued a number of boil water notices.

Chlorine

To address the increased E. coli levels, the city pumped more chlorine into the system as a disinfectant.

TTHM

In January of 2015, residents received warnings that their water didn't meet federal safety standards because tests were showing higher rates of total trihalomethane. TTHM is a byproduct of the chlorine that had been used to address earlier problems. Too much TTHM increases the risk of cancer. Average TTHM levels did not fall to acceptable levels againuntil late this summer.

Lead

In January 2015, the University of Michigan-Flint conducted tests of its own water. Some of their samples contained "high levels of lead." At that time, researchers said the lead levels were high in those samples because the water was spending a lot of time sitting in old pipes.

Activists started asking for courts to force the city to go back to Detroit water in April. Those requests fell short.

An EPA memo leaked in July documented "extremely high levels at one woman's home, high enough that her son got lead poisoning."

Researchers from Virginia Tech tested samples from nearly 300 Flint homes in September. Their findings showed 'seriously' high levels of lead.

On September 24, Flint pediatricians announced their findings that the percentage of Flint children with elevated blood levels has almost doubled since the water source switch.

High Lead Levels In Michigan Kids After City Switches Water Source

NPR All Things Considered

September 29, 2015 6:01 PM ET

Doctors are finding elevated levels of lead in the children in Flint, Mich., and local tap water is the likely cause.

That's the latest alarming news to come out of the city, which switched its water source about a year and a half ago.

A pediatrician with Hurley Medical Center analyzed lead levels of hundreds of children. She compared blood tests before and after April 2014. That's when Flint, unable to come to an agreement on a short-term contract with Detroit, quit buying water from its system, and signed on with a new system that will draw water from Lake Huron.

But that system won't be online until next year. So in the interim, with assurances from the state that it would be safe, the city decided to pump water from the Flint River.

Dr. Citizen name / Ex. 6 [redacted] research found that the percentage of Flint children 5 years and younger with elevated lead levels nearly doubled after the switch, from 2.1 percent to 4 percent.

"My research shows that lead levels have gone up," Citizen name / Ex. 6 [redacted] says. "I cannot say it's from the water. But that's, you know, the thing that has happened."

A Cascade Of Problems

The news did not surprise Citizen name / Ex. 6 She suspected the water had something to do with health problems in her 4-year-old son, Citizen name / Ex. 6

"I kept talking to the doctors, trying to figure out why he wasn't growing," she says. "He was 27 pounds at 4 years old. His hair was thinning, breaking out in rashes."

Complaints about foul-smelling, discolored water began soon after the city started drawing water from the Flint River. In the summer of 2014, the city issued a notice for residents to boil their water because of E. coli contamination.

Then the city was found to be in violation of the Safe Drinking Water Act because of high levels of a disinfectant byproduct called total trihalomethanes — an unintended consequence from all the chlorine the city had to use to kill the E. coli.

Citizen name / Ex. 6 says her whole family broke out in rashes, and they stopped drinking the water in December.

Then, in February of this year, the city tested her water for lead.

"And I got a frantic phone call from the water department telling me to please make sure my kids didn't drink the water, don't mix their juice with it, because they had never seen a number that high for lead," she says.

After that, Citizen name / Ex. 6 decided to take Gavin in to be tested for lead.

He'd been tested before the city switched its water source. At that time, he had a level of 2 micrograms of lead per deciliter of blood. After the switch, his level was 6.5.

The Centers for Disease Control and Prevention says a level of 5 is considered "much higher" than that found in most children. It also says there is no safe level of lead exposure — and the effects, like lower IQ, are irreversible.

A Failure Of Government?

The day after Citizen name / Ex. 6 released her findings, the city put out a lead advisory, urging people to flush their pipes, install inexpensive filters, and use cold water for mixing baby formula.

"As a father, I want every family and household in the city of Flint to be safe and secure," Mayor Dayne Walling said at a press conference to announce the advisory.

Over the summer, researchers from Virginia Tech found that Flint River water is highly corrosive. That means when it comes into contact with lead from service lines, household pipes or solder, it eats away at the lead and sends it right to people's faucets.

City officials and state regulators say they're now putting together a corrosion control plan to reduce lead exposure.

"Flint is the only city in America that I'm aware of that does not have a corrosion control plan," said Virginia Tech's Marc Edwards, who led the research.

Edwards also uncovered lead contamination in Washington, D.C. He says Flint's lead levels are not as high, and the exposure period is not as long as it was in that city. But he has some harsh criticism of city and state officials for how they've handled the Flint situation.

"It was clearly a failure of government agencies to do their job to protect the public," says Edwards, citing the absence of a corrosion control plan from the outset.

A draft report from the EPA that was obtained by the ACLU of Michigan also takes the city and state to task.

"Prior to April 30, 2014, the City of Flint purchased finished water from the City of Detroit which contained orthophosphate, a treatment chemical used to control lead and copper levels in the drinking water," the report read, adding that the treatment was discontinued after the switch to Flint River water.

"In accordance with the Lead and Copper Rule (LCR), all large systems ... are required to install and maintain corrosion control treatment for lead and copper. In the absence of any corrosion control treatment, lead levels in drinking water can be expected to increase," the report continued.

A Solution May Be Near

But officials with the Michigan Department of Environmental Quality dispute the findings of the draft report. MDEQ spokesman Brad Wurfel says the report was the work of a "rogue employee," and promised the final report — not yet released — would tell a much different story.

"You have to have to do a full year of studying" the water chemistry as it behaves across the system before implementing corrosion control, Wurfel says, adding that's the only way to know how much phosphate to add to the water.

An announcement about the corrosion control plan is expected soon. Meanwhile, city officials are showing increasing interest in returning to Detroit's water system — something that even a few days ago they dismissed as economically unfeasible for the cash-strapped city.

Whatever the solution, residents like Citizen name / Ex. 6 say they hope the city can reach one soon.

"I want them to take responsibility," [redacted] says. "I want them to quit poisoning their citizens."

Gov’s office helps get water filters to Flint families

Chad Livengood, Detroit News Lansing Bureau 6:30 p.m. EDT September 29, 2015

Gov. Rick Snyder’s office quietly orchestrated the distribution of 1,500 water filters to Flint families this summer while insisting the city’s water is safe to drink.

In July, Snyder’s office worked with an anonymous corporate donor to distribute the faucet filters through a group of Flint pastors, Snyder spokesman Dave Murray said Tuesday. It was unclear who initiated the plan — the donor, the governor’s office or someone else.

“We worked with the pastors’ group to distribute the filters and asked that members respect the donor’s wishes not to be identified,” Murray said. “We told the group that we’re not looking for credit and appreciated the pastors’ efforts in working with the community on this effort.”

Snyder’s office acknowledged its role Tuesday in handing out the free filters to Flint residents while pressure is mounting on state agencies to fix Flint’s troubled water system. A study last week showed elevated levels of lead in the blood of Flint children younger than 5.

“People have complained about the color and the odor, and faucet filters will help with those challenges as well as improving water quality overall,” Murray said.

The governor's office is in discussions with "a number of groups that are interested" in distributing more faucet filters, Murray said.

The water filters can remove chemical compounds as well as lead, a toxic metal that can hinder brain development in young children even at low levels, according to the U.S. Environmental Protection Agency.

Flint residents began complaining about the taste and color of the city's water in April 2014 when the city halted a half-century of purchasing water from the Detroit Water and Sewerage Department and started pumping drinking water from the Flint River.

River water is a trickier source for municipal cleaning and distribution than Lake Huron, where the Detroit system gets its water. The deeper, still waters of the lake contain few of the organic materials found in river water and require a different treatment protocol.

The Flint River is serving as a temporary water source until the city can connect to a new regional water pipeline from Lake Huron that won't be ready until late 2016.

A year ago, General Motors' Flint Engine Operations plant stopped using the city's river because of concerns about corrosive effects and now gets its water from Flint Township.

Last week, pediatricians at Hurley Medical Center released a study of blood levels of Flint children younger than 5 between January 2013 and September 2013 when Flint used Detroit's water and January and September of this year when residents drank Flint River water.

But Flint's water tested below the federal limit for lead in the Michigan Department of Environmental Quality's 2014 testing, DEQ spokesman Brad Wurfel said Tuesday.

Still, the state agency is working closely to address a “crisis of confidence” among Flint residents, Wurfel said. “Even though it is meeting standards, there is a significant concern in the city of Flint,” he said.

Senate Minority Leader Jim Ananich, D-Flint, has urged Snyder to seek emergency funding to distribute faucet filters to about 15,000 Flint homes.

Ananich also wants the governor to get Flint reconnected to Detroit’s water system.

In January, the Detroit water system offered to reconnect water service to Flint because of the complaints. Flint officials rebuffed the offer, saying an analysis concluded it would cost Flint an additional $12 million per year or more.

Snyder has been non-committal to Ananich’s proposals, but said Tuesday his administration will be taking action soon.

“I have a large team of people working on the Flint water issue as we speak,” Snyder said after an event in Lansing. “What I would say is during the course of the week or early next week, hopefully we’ll be coming out with more public action steps ... and more action steps to take in the future.

“I take it as a serious issue, the Flint water situation. Lead’s a serious issue, so we’re spending a lot of time and effort looking at that and trying to partner with the people in Flint on that issue.”

Flint mayor to state: Approve plan "as fast as humanly possible" to help keep lead out of water

Lindsey Smith , Michigan Radio • 14 hours ago

Flint hasn't been using any corrosion-control method since it switched from Detroit's water system in April 2014. Corrosion-control treatment helps keep lead out of drinking water. Since the switch, more kids are showing up with elevated levels of lead in their blood.

Flint Mayor Dayne Walling says he wants to put corrosion-control treatment back in place, but he needs state approval first. The state says it's going to take a little while to implement.

"One of my requests to (Michigan's) Department of Environmental Quality director is that (approval) be accelerated as fast as humanly possible," Walling said.

"Whatever decisions are coming next, we need that corrosion control in the water treatment process that we have now," he said.

Walling was a guest today on Stateside with Cynthia Canty. (Listen to Flint Mayor Dayne Walling on Stateside: http://cpa.ds.npr.org/michigan/audio/2015/09/20150929-SS-FLINT-WATER.mp3)

Flint spokesman Jason Lorenz says MDEQ made the recommendation to put corrosion-control treatment into the water supply last month. But, he says, it needs MDEQ Director Dan Wyant's official approval.

There’s been some debate over whether Flint should have had corrosion control in place the entire time.

MDEQ officials have argued to the U.S. Environmental Protection Agency that corrosion control is not technically required yet, because the Flint River is a new water source.

“You have to have to do a full year of studying” the water chemistry as it behaves across the system before implementing corrosion control, MDEQ spokesman Brad Wurfel said. He says that’s the only way to know what corrosion-control treatment to use.

That period of study was to be completed by June 30.

As the DEQ reads federal regulations, Flint technically has up to two years after the study to install treatment. But Wurfel says an announcement on the state's decision will come by the end of this week, and "the prescription for optimizing the system for corrosion control is going to be done in Flint by the end of this year."

"We have a plan to expedite this with the city ... and folks can take some comfort in that," Wurfel said.

It's not clear yet how much the treatment will cost, but Wurfel says "this won't break the bank." A state-appointed emergency manager made the interim switch to the Flint River to save the city money.

The U.S. Environmental Protection Agency has not yet answered this question: Was Flint required to have some form of corrosion-control treatment the whole time?

At face value, the EPA rules are clear, all water systems that serve more than 50,000 people must have some kind of corrosion control.

But when you switch water sources, there is apparently some room for interpretation.

In approving updates to this federal regulation in 2000, the EPA noted that “water systems need to make treatment changes, on occasion, to react to changing circumstances.”

In these cases, the rule does not “prevent a state from approving treatment changes,” but it’s not entirely clear if the state can approve having zero corrosion-control treatment.

One key section of the rule change reads:

“One commenter requested that EPA clarify in the rule language that (large water) systems are not required to have (corrosion-control treatment) physically present. EPA disagrees that this is appropriate.”

“For large water systems, (the federal rule) does not eliminate the need to have any (corrosion-control treatment) in place, unless the water system can demonstrate to the satisfaction of the State that such treatment will have no effect on reducing the levels of lead and copper at the tap … EPA expects few, if any, large water systems can make this demonstration without (corrosion-control treatment).”

Flint residents can be sure about one thing: This period of study and approval won’t happen the next time the city switches water sources.

The city expects to stop using the Flint River when a new regional water system in Genesee County is completed, slated for the end of 2016. According the MDEQ’s Brad Wurfel, that’s because they won’t need to study the nature of the new water source – Lake Huron. Because Detroit’s water system uses water from Lake Huron, Flint will be able to use the same corrosion-control treatment it did when it was hooked up to Detroit’s system.

---

http://michiganradio.org/post/have-you-missed-parts-flint-water-story-heres-quick-rundown#stream/0

Have you missed parts of the Flint water story? Here's a quick rundown.

Michigan Radio Newsroom • Sep 25, 2015

Flint switched its drinking water source in April of 2014. The city went from Detroit water to water from the Flint River, and there have been problems ever since.

Most recently, residents have been enraged to hear about elevated lead levels in kids. At this point, Flint residents have been unsure about the safety of their water for over a year.

Here's a quick rundown of the problems some Flint residents have been complaining about.

Discoloration and smell

Water issues started right after the switch as residents complained that the new water smelled and tasted different. City officials issued boil water advisories but insisted this was not connected to the switch.

E. coli

Tests of Flint water showed high levels of bacteria, including E. coli. Residents were issued a number of boil water notices.

Chlorine

To address the increased E. coli levels, the city pumped more chlorine into the system as a disinfectant.

TTHM

In January of 2015, residents received warnings that their water didn't meet federal safety standards because tests were showing higher rates of total trihalomethane. TTHM is a byproduct of the chlorine that had been used to address earlier problems. Too much TTHM increases the risk of cancer. Average TTHM levels did not fall to acceptable levels againuntil late this summer.

Lead

In January 2015, the University of Michigan-Flint conducted tests of its own water. Some of their samples contained "high levels of lead." At that time, researchers said the lead levels were high in those samples because the water was spending a lot of time sitting in old pipes.

Activists started asking for courts to force the city to go back to Detroit water in April. Those requests fell short.

An EPA memo leaked in July documented "extremely high levels at one woman's home, high enough that her son got lead poisoning."

Researchers from Virginia Tech tested samples from nearly 300 Flint homes in September. Their findings showed 'seriously' high levels of lead.

On September 24, Flint pediatricians announced their findings that the percentage of Flint children with elevated blood levels has almost doubled since the water source switch.

COMMENTARY: MDEQ Mistakes and Deception Created the Flint Water Crisis

September 30, 2015September 30, 2015 Siddhartha Roy Articles

Primary Author: Dr. Marc Edwards

Acknowledgements: Curt Guyette, LeeAnne Walters, Melissa Mays, Siddhartha Roy

As results of our collaborative research with Flint residents exposed widespread problems with elevated levels of lead in Flint's water, the Michigan Department of Environmental Quality (MDEQ) repeatedly attempted to discredit our findings and downplay the public health threat. For example, MDEQ's Communications Director Brad Wurfel wrote to The Flint Journal's Ronald Fonger:

"…the state DEQ is just as perplexed by Edwards' results as he seems to be by the City's test results. When I said we were unsure how the Virginia Tech team got its results, that's not the same as being surprised that they got them. …this group specializes in looking for high lead problems. They pull that rabbit out of that hat everywhere they go. Nobody should be

surprised when the rabbit comes out of the hat, even if they can't figure out how it is done.....while the state appreciates academic participation in this discussion, offering broad, dire public health advice based on some quick testing could be seen as fanning political flames irresponsibly. Residents of Flint concerned about the health of their community don't need more of that."

Now that Dr. Mona Hanna-Attisha and Hurley Medical Center researchers have revealed that the rising levels of lead in Flint water have been associated with increased blood lead of Flint's children, our early health advice has been vindicated by most accounts. But MDEQ still dismisses the water controversy as "near-hysteria," and characterizes the Hurley study conclusions as ***"unfortunate"*** if not quite ***"irresponsible."***

Given MDEQ's insistence that there is absolutely nothing wrong with Flint water, we have created a timeline that illustrates how MDEQ's mistakes and deception created the Flint Water Crisis in the first place. Our analysis relies on e-mails and documents obtained through Freedom of Information Act (FOIA) requests by the American Civil Liberties Union-Michigan (ACLU of Michigan) and FlintWaterStudy.org.

All FOIA documents are provided at the end of this article for review.

Phase 1. MDEQ Fails to Require Corrosion Control for Flint River Water (April 2014)

Effective July 1998, the federal Lead and Copper Rule (LCR) has required that all large public water systems maintain a program to control levels of lead in drinking water from corrosion. Moreover, the law also requires the City of Flint to have a state approved plan, with enforceable regulatory limits for "Water Quality Parameters" including pH, alkalinity and/or corrosion inhibitor dose measured in the water distribution system.

MDEQ never required Flint to have a corrosion control program, nor did it set water quality parameters for the new Flint River source water. While MDEQ asserts that they are acting proactively to get a corrosion control program in Flint, there is no provision in the LCR that allows for corrosion control to ever be interrupted.

As a direct result of this mistake, Flint residents have been completely unprotected from elevated lead in water from the moment the switch to Flint River water was made. This has created a conflict of interest for MDEQ ever since. Specifically, MDEQ's failure to require a corrosion control program is what created the Flint water crisis in the first place–they now have a vested interest in covering up the problem.

Phase 2. MDEQ misinforms the USEPA about Flint's Corrosion Control (February-March 2015)

Even if we assume MDEQ was confused about its obligations under the LCR, when problems with high lead started to crop up in February 2015, they should have quickly acted to correct the mistake. Samples with high lead were reported at the University of Michigan-Flint Campus, and on February 26, 2015 Mike Glasgow (City of Flint) did excellent detective work discovering high lead (over 100 ppb) in water samples from Flint resident Lee-Anne Walters' home.

Ms. Walters immediately forwarded her results to representatives of USEPA Region 5, who in turn immediately forwarded the results to Stephen Busch and Mike Prysby (MDEQ) with the subject line **"HIGH LEAD: FLINT Water testing Results"** The EPA e-mail correctly informed MDEQ that Ms. Walters' high lead was likely due to ***"… the different chemistry water…leaching out contaminants from the insides of…the pipes."*** But MDEQ denied to EPA that that Flint had a lead in water problem.

At that point, EPA Region 5 lead-in-water expert Miguel Del Toral asked MDEQ a question through another EPA employee:

"Miguel was wondering if Flint is feeding Phosphates. Flint must have Optimal Corrosion Control Treatment-is it Phosphates?"

On February 27th, 2015, MDEQ's Stephen Busch unequivocally and falsely responded to EPA that:

"The City of Flint…Has an Optimized Corrosion Control Program <and> Conducts quarterly Water Quality Parameter monitoring at 25 sites and has not had any unusual results."

Reassured by MDEQ's false statement, Del Toral ended USEPA's February conversation with MDEQ by stating:

"If I remember correctly, Detroit is feeding PO4 for the LCR, but since Flint is no longer part of that interconnection, I was wondering what their <Optimal Corrosion Control> was. They are required to have <Optimal Corrosion Control> in place which is why I was asking what they were using."

On March 18, 2015, Lee-Anne Walters' home was retested after flushing her system thoroughly. This time the test result came back even worse with 397 ppb lead– almost 40 times higher than the World Health Organization 10 ppb safety threshold. EPA Region 5 forwarded the results to MDEQ, with a query ***"Any thoughts on how to respond to her? I'm running out of ideas."***

MDEQ's response, delivered in a voicemail to Del Toral on March 19, 2015, stated that ***MDEQ had investigated and found Ms. Walters' high lead was due to lead sources in her plumbing***. On March 27, 2015, Walters' son, who had been having health problems, was tested for lead in his blood. The blood lead results came back high– well over the 5 ug/dL CDC threshold of concern.

Phase 3. Walters and Del Toral Investigate the Veracity of MDEQ Statements (April to June 2015)

With good reason, Lee-Anne Walters did not accept the MDEQ's explanation to Del Toral for the high lead in her water. The internal plumbing had been stolen from the house before it was purchased, and they had installed new (lead free) plastic plumbing before moving in.

Walters also checked up on the MDEQ statement that Flint had "an Optimized Corrosion Control Program." She called the City of Flint, and city officials correctly informed her that there was no program at all.

Walters then passed this alarming information along to EPA's Del Toral, who on April 23rd e-mailed MDEQ, and again asked what corrosion control program Flint was using. It was only then that MDEQ finally acknowledged that there was NO program. Concerned due to the very high occurrence of lead service lines (LSLs) in Flint, on April 27th Del Toral wrote an EPA Region 5 internal e-mail stating:

"Flint has not been operating any corrosion control treatment, which is very concerning given the likelihood of LSLs in the City."

That night Del Toral also stopped at Walters' house on a trip north, and personally inspected her plumbing first hand. He confirmed it was plastic and lead-free. Del Toral also dropped off sample bottles at the Walters' home, and told her that if she wanted an analysis to contact Professor Marc Edwards (the author of this article and Principal Investigator of FlintWaterStudy.org) at Virginia Tech.

The next morning Edwards talked Walters through an intensive 30 bottle sampling protocol. When the bottles were returned to Virginia Tech and analyzed, Edwards and his senior research scientist Dr. Jeff Parks were stunned by the results. The average lead in was 2,429 ppb lead, the high was 13,200 ppb, and even after 25 minutes flushing the water never dropped below 200 ppb. After Walters told Del Toral about the high lead results, he drove back to Flint, just in time to observe the City replacing the service line to Walters' home. He personally collected a sample of the pipe and verified it to be pure lead.

In a follow-up memo dated June 24, 2015, which was sent to both Walters and Edwards, Del Toral outlined numerous concerns about the situation regarding the serious lead corrosion problem in Flint. *He included a clear recommendation that the USEPA investigate whether* *the City of Flint was in compliance with federal laws for lead corrosion control.*

Phase 4. MDEQ "Handles" the LCR Report, ACLU-Michigan, Virginia Tech and Miguel Del Toral (July to August 2015)

> "Revising" the Original LCR Report. In spite of all the problems documented with lead in Flint water from February to June 2015, Flint and MDEQ took a lackadaisical approach to the federally required LCR sampling program. Specifically, just 5 days before the June 30th deadline to collect the 100 samples that MDEQ required, the City had only collected 39 samples.

Adam Rosenthal (MDEQ) e-mailed Mike Glasgow at the City of Flint:

> ***"We hope you have 61 more lead/copper samples collected and sent to the lab by 6/30/15, and that they will be below the AL for lead. As of now with 39 results, Flint's 90th percentile is over the AL for lead."***

In the next five days the City collected 30 samples, all of which were below the action level, and did not reach the 100 sample target. If all 71 submitted samples had been considered valid, the City would have exceeded the 15 ppb action level. *Federal law would then require that Flint residents be provided information about how to protect themselves and their children from lead in water. MDEQ's failure to install corrosion control would have been flagged as an obvious mistake. But none of that happened.*

Instead, the MDEQ "revised" the City's original LCR report, invalidating two high lead results, so that the 90%'ile was under the 15 ppb action level. The validity of samples showing low lead in the City's sampling was never questioned. This is a problem, because the City has now admitted that they do not know which homes had lead pipe, even though it is stated in writing in the report that all sampled homes had lead pipe. By law, at least 50 percent of the homes sampled must be verified to have lead pipe, and the remainder of homes sampled must have been built before 1986 and known to have lead solder.

There is no basis for believing that this requirement was met in either the 2014 or 2015 LCR sampling events conducted by the City. Hence, the City of Flint has not had a valid LCR sampling event since the switch to Flint River water.

MDEQ then lowered the minimum number of required samples from 100 to 60, making it look like the City of Flint had met the target. MDEQ also did not question the City's open acknowledgement that homes from 2014 had not been re-sampled, or that high risk (Tier 1) sites were not used. The original report, due July 10th, was also late by several weeks. All of these violations of federal law were glossed over, to make it appear that the City had passed its lead testing with flying colors. Just like that, according to MDEQ at least, the City of Flint had no LCR violations at all.

> ACLU-Michigan FOIA. The timing by which the "revised" LCR report was created, is also of interest. On July 22, 2015, the ACLU-Michigan submitted a FOIA to MDEQ, requesting the City of Flint's LCR report supposedly due on July 10, 2015. The City's original LCR report with all the obvious problems is dated July 28, 2015. MDEQ never provided the ACLU-Michigan with the original LCR report. Instead, they created the scrubbed revised report, on August 20, 2015, and sent that report to ALCU-Michigan (from the City of Flint) the next day. In the comments section of the report, Flint openly states ***"Revised report after conference call with DEQ staff. Two samples were removed from list for not meeting sample criteria, and due to population the number of samples was reduced to 60."***

> MDEQ to FlintWaterStudy.org FOIA: What conference call? On September 9, 2015, Virginia Tech submitted a FOIA to MDEQ explicitly requesting records and minutes of the conference call between DEQ staff and Flint cited in the revised LCR report. This FOIA request has been denied by MDEQ, because ***"Your request does not include the date/time of the conference call and who from the Department of Environmental Quality participated on the conference call."*** FlintWaterStudy.org immediately appealed the withholding of documents related to the conference call to the State of

Michigan. On September 28th, our appeal was denied. We may commence a civil action if we do not agree with the decision.

> Handling Miguel Del Toral. MDEQ obviously had a major problem on its hands with EPA's lead-in-water expert Miguel Del Toral. On August 4th 2015, Lee-Anne Walters and Melissa Mays met with MDEQ officials to discuss Flint's lead in water problems. The MDEQ officials participating in the meeting were identified by Mays and Walters, as Liane Shekter-Smith (Chief of the Office of Drinking Water and Municipal Assistance), Stephen Busch and Brad Wurfel.

According to Walters and Mays, Shekter-Smith bragged that ***"Mr. Del Toral has been handled,"*** and that Flint residents would not be hearing from him again. Moreover, MDEQ asserted that Mr. Del Toral's interim memo detailing the many problems with Flint's (non-existent) corrosion control program ***"would never be finalized."*** Just yesterday, NPR released a slightly different, but enlightening version of Wurfel's take on Del Toral and the memo:

MDEQ spokesman Brad Wurfel says the report was the work of a "rogue employee," and promised the final report — not yet released — would tell a much different story.

Mays and Walters vividly recall Wurfel, smirking or laughing, whenever they expressed concern about elevated lead in Flint's water. Looking back on the exchange yesterday, Mays stated ***"It is shocking how their refusal to admit they made a mistake, trumped the dangers their actions pose to Flint's children."***

Angered, Lee-Anne Walters then called Edwards, and informed him that Del Toral would no longer be working on Flint water issues, and the two discussed the clear implication that EPA bureaucrats had intervened to prevent Del Toral from further exposing MDEQ's numerous blunders and the health threat to Flint residents. She further stated that ***"It is too late for my son, but I will not stand by and let this happen to another other innocent child in Flint."***

Clearly, the MDEQ, City of Flint and even the USEPA (with the obvious exception of Del Toral) have proved themselves unworthy of the public trust. Flint residents have been left to fend for themselves, when it comes to dealing with the dangers of high lead in their water.

FlintWaterStudy was launched an hour after the phone call from Ms. Walters, to help the citizens of Flint deal with the lead-in-water crisis that MDEQ created, and to correct any false statements by uncaring agencies that have left Flint's children in harm's way.

Now that Dr. Mona Hanna-Attisha and Hurley Medical Center researchers have revealed that the rising levels of lead in Flint water have been associated with increased blood lead of Flint's children, our early health advice has been vindicated by most accounts. But MDEQ still dismisses the water controversy as "near-hysteria," and characterizes the Hurley study conclusions as ***"unfortunate"*** if not quite ***"irresponsible."***

Given MDEQ's insistence that there is absolutely nothing wrong with Flint water, we have created a timeline that illustrates how MDEQ's mistakes and deception created the Flint Water Crisis in the first place. Our analysis relies on e-mails and documents obtained through Freedom of Information Act (FOIA) requests by the American Civil Liberties Union-Michigan (ACLU of Michigan) and FlintWaterStudy.org.

All FOIA documents are provided at the end of this article for review.

Phase 1. MDEQ Fails to Require Corrosion Control for Flint River Water (April 2014)

Effective July 1998, the federal Lead and Copper Rule (LCR) has required that all large public water systems maintain a program to control levels of lead in drinking water from corrosion. Moreover, the law also requires the City of Flint to have a state approved plan, with enforceable regulatory limits for "Water Quality Parameters" including pH, alkalinity and/or corrosion inhibitor dose measured in the water distribution system.

MDEQ never required Flint to have a corrosion control program, nor did it set water quality parameters for the new Flint River source water. While MDEQ asserts that they are acting proactively to get a corrosion control program in Flint, there is no provision in the LCR that allows for corrosion control to ever be interrupted.

As a direct result of this mistake, Flint residents have been completely unprotected from elevated lead in water from the moment the switch to Flint River water was made. This has created a conflict of interest for MDEQ ever since. Specifically, MDEQ's failure to require a corrosion control program is what created the Flint water crisis in the first place–they now have a vested interest in covering up the problem.

Phase 2. MDEQ misinforms the USEPA about Flint's Corrosion Control (February-March 2015)

Even if we assume MDEQ was confused about its obligations under the LCR, when problems with high lead started to crop up in February 2015, they should have quickly acted to correct the mistake. Samples with high lead were reported at the University of Michigan-Flint Campus, and on February 26, 2015 Mike Glasgow (City of Flint) did excellent detective work discovering high lead (over 100 ppb) in water samples from Flint resident Lee-Anne Walters' home.

Ms. Walters immediately forwarded her results to representatives of USEPA Region 5, who in turn immediately forwarded the results to Stephen Busch and Mike Prysby (MDEQ) with the subject line **"HIGH LEAD: FLINT Water testing Results"** The EPA e-mail correctly informed MDEQ that Ms. Walters' high lead was likely due to ***"... the different chemistry water…leaching out contaminants from the insides of…the pipes."*** But MDEQ denied to EPA that that Flint had a lead in water problem.

At that point, EPA Region 5 lead-in-water expert Miguel Del Toral asked MDEQ a question through another EPA employee:

"Miguel was wondering if Flint is feeding Phosphates. Flint must have Optimal Corrosion Control Treatment-is it Phosphates?"

On February 27th, 2015, MDEQ's Stephen Busch unequivocally and falsely responded to EPA that:

"The City of Flint…Has an Optimized Corrosion Control Program <and> Conducts quarterly Water Quality Parameter monitoring at 25 sites and has not had any unusual results."

Reassured by MDEQ's false statement, Del Toral ended USEPA's

February conversation with MDEQ by stating:

"If I remember correctly, Detroit is feeding PO4 for the LCR, but since Flint is no longer part of that interconnection, I was wondering what their <Optimal Corrosion Control> was. They are required to have <Optimal Corrosion Control> in place which is why I was asking what they were using."

On March 18, 2015, Lee-Anne Walters' home was retested after flushing her system thoroughly. This time the test result came back even worse with 397 ppb lead– almost 40 times higher than the World Health Organization 10 ppb safety threshold. EPA Region 5 forwarded the results to MDEQ, with a query ***"Any thoughts on how to respond to her? I'm running out of ideas."***

MDEQ's response, delivered in a voicemail to Del Toral on March 19, 2015, stated that ***MDEQ had investigated and found Ms. Walters' high lead was due to lead sources in her plumbing***. On March 27, 2015, Walters' son, who had been having health problems, was tested for lead in his blood. The blood lead results came back high– well over the 5 ug/dL CDC threshold of concern.

Phase 3. Walters and Del Toral Investigate the Veracity of MDEQ Statements (April to June 2015)

With good reason, Lee-Anne Walters did not accept the MDEQ's explanation to Del Toral for the high lead in her water. The internal plumbing had been stolen from the house before it was purchased, and they had installed new (lead free) plastic plumbing before moving in.

Walters also checked up on the MDEQ statement that Flint had "an Optimized Corrosion Control Program." She called the City of Flint, and city officials correctly informed her that there was no program at all.

Walters then passed this alarming information along to EPA's Del Toral, who on April 23rd e-mailed MDEQ, and again asked what corrosion control program Flint was using. It was only then that MDEQ finally acknowledged that there was NO program. Concerned due to the very high occurrence of lead service lines (LSLs) in Flint, on April 27th Del Toral wrote an EPA Region 5 internal e-mail stating:

"Flint has not been operating any corrosion control treatment, which is very concerning given the likelihood of LSLs in the City."

That night Del Toral also stopped at Walters' house on a trip north, and personally inspected her plumbing first hand. He confirmed it was plastic and lead-free. Del Toral also dropped off sample bottles at the Walters' home, and told her that if she wanted an analysis to contact Professor Marc Edwards (the author of this article and Principal Investigator of FlintWaterStudy.org) at Virginia Tech.

The next morning Edwards talked Walters through an intensive 30 bottle sampling protocol. When the bottles were returned to Virginia Tech and analyzed, Edwards and his senior research scientist Dr. Jeff Parks were stunned by the results. The average lead in was 2,429 ppb lead, the high was 13,200 ppb, and even after 25 minutes flushing the water never dropped below 200 ppb. After Walters told Del Toral about the high lead results, he drove back to Flint, just in time to observe the City replacing the service line to Walters' home. He personally collected a sample of the pipe and verified it to be pure lead.

In a follow-up memo dated June 24, 2015, which was sent to both Walters and Edwards, Del Toral outlined numerous concerns about the situation regarding the serious lead corrosion problem in Flint. *He included a clear recommendation that the USEPA investigate whether the City of Flint was in compliance with federal laws for lead corrosion control.*

Phase 4. MDEQ "Handles" the LCR Report, ACLU-Michigan, Virginia Tech and Miguel Del Toral (July to August 2015)

> "Revising" the Original LCR Report. In spite of all the problems documented with lead in Flint water from February to June 2015, Flint and MDEQ took a lackadaisical approach to the federally required LCR sampling program. Specifically, just 5 days before the June 30th deadline to collect the 100 samples that MDEQ required, the City had only collected 39 samples.

Adam Rosenthal (MDEQ) e-mailed Mike Glasgow at the City of Flint:

"We hope you have 61 more lead/copper samples collected and sent to the lab by 6/30/15, and that they will be below the AL for lead. As of now with 39 results, Flint's 90th percentile is over the AL for lead."

In the next five days the City collected 30 samples, all of which were below the action level, and did not reach the 100 sample target. If all 71 submitted samples had been considered valid, the City would have exceeded the 15 ppb action level. *Federal law would then require that Flint residents be provided information about how to protect themselves and their children from lead in water. MDEQ's failure to install corrosion control would have been flagged as an obvious mistake. But none of that happened.*

Instead, the MDEQ "revised" the City's original LCR report, invalidating two high lead results, so that the 90%'ile was under the 15 ppb action level. The validity of samples showing low lead in the City's sampling was never questioned. This is a problem, because the City has now admitted that they do not know which homes had lead pipe, even though it is stated in writing in the report that all sampled homes had lead pipe. By law, at least 50 percent of the homes sampled must be verified to have lead pipe, and the remainder of homes sampled must have been built before 1986 and known to have lead solder. There is no basis for believing that this requirement was met in either the 2014 or 2015 LCR sampling events conducted by the City. Hence, the City of Flint has not had a valid LCR sampling event since the switch to Flint River water.

MDEQ then lowered the minimum number of required samples from 100 to 60, making it look like the City of Flint had met the target.

MDEQ also did not question the City's open acknowledgement that homes from 2014 had not been re-sampled, or that high risk (Tier 1) sites were not used. The original report, due July 10th, was also late by several weeks. All of these violations of federal law were glossed over, to make it appear that the City had passed its lead testing with flying colors. Just like that, according to MDEQ at least, the City of Flint had no LCR violations at all.

> **ACLU-Michigan FOIA**. The timing by which the "revised" LCR report was created, is also of interest. On July 22, 2015, the ACLU-Michigan submitted a FOIA to MDEQ, requesting the City of Flint's LCR report supposedly due on July 10, 2015. The City's original LCR report with all the obvious problems is dated July 28, 2015. MDEQ never provided the ACLU-Michigan with the original LCR report. Instead, they created the scrubbed revised report, on August 20, 2015, and sent that report to ALCU-Michigan (from the City of Flint) the next day. In the comments section of the report, Flint openly states ***"Revised report after conference call with DEQ staff. Two samples were removed from list for not meeting sample criteria, and due to population the number of samples was reduced to 60."***

> **MDEQ to FlintWaterStudy.org FOIA: What conference call?** On September 9, 2015, Virginia Tech submitted a FOIA to MDEQ explicitly requesting records and minutes of the conference call between DEQ staff and Flint cited in the revised LCR report. This FOIA request has been denied by MDEQ, because ***"Your request does not include the date/time of the conference call and who from the Department of Environmental Quality participated on the conference call."*** FlintWaterStudy.org immediately appealed the withholding of documents related to the conference call to the State of Michigan. On September 28th, our appeal was denied. We may commence a civil action if we do not agree with the decision.

> **Handling Miguel Del Toral.** MDEQ obviously had a major problem on its hands with EPA's lead-in-water expert Miguel Del Toral. On August 4th 2015, Lee-Anne Walters and Melissa Mays met with MDEQ officials to discuss Flint's lead in water problems. The MDEQ officials

participating in the meeting were identified by Mays and Walters, as Liane Shekter-Smith (Chief of the Office of Drinking Water and Municipal Assistance), Stephen Busch and Brad Wurfel.

According to Walters and Mays, Shekter-Smith bragged that ***"Mr. Del Toral has been handled,"*** and that Flint residents would not be hearing from him again. Moreover, MDEQ asserted that Mr. Del Toral's interim memo detailing the many problems with Flint's (non-existent) corrosion control program ***"would never be finalized."*** Just yesterday, NPR released a slightly different, but enlightening version of Wurfel's take on Del Toral and the memo:

MDEQ spokesman Brad Wurfel says the report was the work of a "rogue employee," and promised the final report — not yet released — would tell a much different story.

Mays and Walters vividly recall Wurfel, smirking or laughing, whenever they expressed concern about elevated lead in Flint's water. Looking back on the exchange yesterday, Mays stated ***"It is shocking how their refusal to admit they made a mistake, trumped the dangers their actions pose to Flint's children."***

Angered, Lee-Anne Walters then called Edwards, and informed him that Del Toral would no longer be working on Flint water issues, and the two discussed the clear implication that EPA bureaucrats had intervened to prevent Del Toral from further exposing MDEQ's numerous blunders and the health threat to Flint residents. She further stated that ***"It is too late for my son, but I will not stand by and let this happen to another other innocent child in Flint."***

Clearly, the MDEQ, City of Flint and even the USEPA (with the obvious exception of Del Toral) have proved themselves unworthy of the public trust. Flint residents have been left to fend for themselves, when it comes to dealing with the dangers of high lead in their water.

FlintWaterStudy was launched an hour after the phone call from Ms. Walters, to help the citizens of Flint deal with the lead-in-water crisis that MDEQ created, and to correct any false statements by uncaring agencies that have left Flint's children in harm's way.

Subject: Flint

Darren/Mike: Unless you've gotten different instructions from your management chain, I'm looking for you to provide technical assistance to Flint/MDEQ on how to best implement corrosion control for lead. Flint needs to do something as soon as possible. When the technical experts get together, there may be parallel tracks of what to do in the short-term while Flint is us using the Flint River and what is the long-term solution. Even if the long-term solution is to go back to Detroit, it will take time and in the meantime the Flint River will still be used.

Obviously, knowing where lead is being found and at what concentrations will be helpful in the consideration of corrosion control implementation. The lab slips that we have of their last round of compliance monitoring is not enough to determine whether the right homes were sampled. More information from MDEQ and/or Flint will be needed and possibly collecting additional samples that the TAC may need.

COMMENTARY: MDEQ Mistakes and Deception Created the Flint Water Crisis

September 30, 2015September 30, 2015 Siddhartha Roy Articles

Primary Author: Dr. Marc Edwards

Acknowledgements: Citizen name / Ex. 6, Citizen name / Ex. 6 Citizen name / Ex. 6 Citizen name / Ex. 6 Citizen name / Ex. 6

As results of our collaborative research with Flint residents exposed widespread problems with elevated levels of lead in Flint's water, the Michigan Department of Environmental Quality (MDEQ) repeatedly attempted to discredit our findings and downplay the public health threat. For example, MDEQ's Communications Director Brad Wurfel wrote to The Flint Journal's Ronald Fonger:

> ***"…the state DEQ is just as perplexed by Edwards' results as he seems to be by the City's test results. When I said we were unsure how the Virginia Tech team got its results, that's not the same as being surprised that they got them. …this group specializes in looking for high lead problems. They pull that rabbit out of that hat everywhere they go. Nobody should be surprised when the rabbit comes out of the hat, even if they can't figure out how it is done…..while the state appreciates academic participation in this discussion, offering broad, dire public health advice based on some quick testing could be seen as fanning political flames irresponsibly. Residents of Flint concerned about the health of their community don't need more of that."***

Now that **Citizen name / Ex. 6** and Hurley Medical Center researchers have revealed that the rising levels of lead in Flint water have been associated with increased blood lead of Flint's children, our early health advice has been vindicated by most accounts. But MDEQ still dismisses the water controversy as "near-hysteria," and characterizes the Hurley study conclusions as ***"unfortunate"*** if not quite ***"irresponsible."***

Given MDEQ's insistence that there is absolutely nothing wrong with Flint water, we have created a timeline that illustrates how MDEQ's mistakes and deception created the Flint Water Crisis in the first place. Our analysis relies on e-mails and documents obtained through Freedom of Information Act (FOIA) requests by the American Civil Liberties Union-Michigan (ACLU of Michigan) and FlintWaterStudy.org.

All FOIA documents are provided at the end of this article for review.

Phase 1. MDEQ Fails to Require Corrosion Control for Flint River Water (April 2014)

Effective July 1998, the federal Lead and Copper Rule (LCR) has required that all large public water systems maintain a program to control levels of lead in drinking water from corrosion. Moreover, the law also requires the City of Flint to have a state approved plan, with enforceable regulatory limits for "Water Quality Parameters" including pH, alkalinity and/or corrosion inhibitor dose measured in the water distribution system.

MDEQ never required Flint to have a corrosion control program, nor did it set water quality parameters for the new Flint River source water. While MDEQ asserts that they are acting proactively to get a corrosion control program in Flint, there is no provision in the LCR that allows for corrosion control to ever be interrupted.

As a direct result of this mistake, Flint residents have been completely unprotected from elevated lead in water from the moment the switch to Flint River water was made. This has created a conflict of interest for MDEQ ever since. Specifically, MDEQ's failure to require a corrosion control program is what created the Flint water crisis in the first place–they now have a vested interest in covering up the problem.

Phase 2. MDEQ misinforms the USEPA about Flint's Corrosion Control (February-March 2015)

Even if we assume MDEQ was confused about its obligations under the LCR, when problems with high lead started to crop up in February 2015, they should have quickly acted to correct the mistake. Samples with high lead were reported at the University of Michigan-Flint Campus, and on February 26, 2015 Mike Glasgow (City of Flint) did excellent detective work discovering high lead (over 100 ppb) in water samples from Flint resident Citizen name / Ex. 6 Citizen name / Ex. 6 home.

Citizen name / Ex. 6 immediately forwarded her results to representatives of USEPA Region 5, who in turn immediately forwarded the results to Stephen Busch and Mike Prysby (MDEQ) with the subject line **"HIGH LEAD: FLINT Water testing Results"** The EPA e-mail correctly informed MDEQ that Citizen name / Ex. 6 high lead was likely due to ***"... the different chemistry water...leaching out***

contaminants from the insides of…the pipes." But MDEQ denied to EPA that that Flint had a lead in water problem.

At that point, EPA Region 5 lead-in-water expert Miguel Del Toral asked MDEQ a question through another EPA employee:

"Miguel was wondering if Flint is feeding Phosphates. Flint must have Optimal Corrosion Control Treatment-is it Phosphates?"

On February 27th, 2015, MDEQ's Stephen Busch unequivocally and falsely responded to EPA that:

"The City of Flint…Has an Optimized Corrosion Control Program <and> Conducts quarterly Water Quality Parameter monitoring at 25 sites and has not had any unusual results."

Reassured by MDEQ's false statement, Del Toral ended USEPA's February conversation with MDEQ by stating:

"If I remember correctly, Detroit is feeding PO4 for the LCR, but since Flint is no longer part of that interconnection, I was wondering what their <Optimal Corrosion Control> was. They are required to have <Optimal Corrosion Control> in place which is why I was asking what they were using."

On March 18, 2015, Citizen name / Ex. 6' home was retested after flushing her system thoroughly. This time the test result came back even worse with 397 ppb lead– almost 40 times higher than the World Health Organization 10 ppb safety threshold. EPA Region 5 forwarded the results to MDEQ, with a query ***"Any thoughts on how to respond to her? I'm running out of ideas."***

MDEQ's response, delivered in a voicemail to Del Toral on March 19, 2015, stated that ***MDEQ had investigated and found*** Citizen name / Ex. 6 Citizen name / Ex. 6 ***high lead was due to lead sources in her plumbing***. On March 27, 2015, Citizen name / Ex. 6 son, who had been having health problems, was tested for lead in his blood. The blood lead results came back high– well over the 5 ug/dL CDC threshold of concern.

Phase 3. Citizen name / Ex. 6 and Del Toral Investigate the Veracity of MDEQ Statements (April to June 2015)

With good reason, Citizen name / Ex. 6 did not accept the MDEQ's explanation to Del Toral for the high lead in her water. The internal plumbing had been stolen from the house before it was purchased, and they had installed new (lead free) plastic plumbing before moving in.

Citizen name / Ex. 6 also checked up on the MDEQ statement that Flint had "an Optimized Corrosion Control Program." She called the City of Flint, and city officials correctly informed her that there was no program at all.

Citizen name / Ex. 6 then passed this alarming information along to EPA's Del Toral, who on April 23rd e-mailed MDEQ, and again asked what corrosion control program Flint was using. It was only then that MDEQ finally acknowledged that there was NO program. Concerned due to the very high occurrence of lead service lines (LSLs) in Flint, on April 27th Del Toral wrote an EPA Region 5 internal e-mail stating:

"Flint has not been operating any corrosion control treatment, which is very concerning given the likelihood of LSLs in the City."

That night Del Toral also stopped at Citizen name / Ex. 6 house on a trip north, and personally inspected her plumbing first hand. He confirmed it was plastic and lead-free. Del Toral also dropped off sample bottles at the Citizen name / Ex. 6 home, and told her that if she wanted an analysis to contact Professor Marc Edwards (the author of this article and Principal Investigator of FlintWaterStudy.org) at Virginia Tech.

The next morning Edwards talked Citizen name / Ex. 6 through an intensive 30 bottle sampling protocol. When the bottles were returned to Virginia Tech and analyzed, Edwards and his senior research scientist Dr. Jeff Parks were stunned by the results. The average lead in was 2,429 ppb lead, the high was 13,200 ppb, and even after 25 minutes flushing the water never dropped below 200 ppb. After Walters told Del Toral about the high lead results, he drove back to Flint, just in time to observe the City replacing the service line to Walters' home. He personally collected a sample of the pipe and verified it to be pure lead.

In a follow-up memo dated June 24, 2015, which was sent to both Walters and Edwards, Del Toral outlined numerous concerns about the situation regarding the serious lead corrosion problem in Flint. *He included a clear recommendation that the USEPA investigate whether the City of Flint was in compliance with federal laws for lead corrosion control.*

Phase 4. MDEQ "Handles" the LCR Report, ACLU-Michigan, Virginia Tech and Miguel Del Toral (July to August 2015)

> "Revising" the Original LCR Report. In spite of all the problems documented with lead in Flint water from February to June 2015, Flint and MDEQ took a lackadaisical approach to the federally required LCR sampling program. Specifically, just 5 days before the June 30th deadline to collect the 100 samples that MDEQ required, the City had only collected 39 samples.

Adam Rosenthal (MDEQ) e-mailed Mike Glasgow at the City of Flint:

"We hope you have 61 more lead/copper samples collected and sent to the lab by 6/30/15, and that they will be below the AL for lead. As of now with 39 results, Flint's 90th percentile is over the AL for lead."

In the next five days the City collected 30 samples, all of which were below the action level, and did not reach the 100 sample target. If all 71 submitted samples had been considered valid, the City would have exceeded the 15 ppb action level. *Federal law would then require that Flint residents be provided information* *about how to protect themselves and their children from lead in water. MDEQ's failure to install corrosion control would have been flagged as an obvious mistake. But none of that happened.*

Instead, the MDEQ "revised" the City's original LCR report, invalidating two high lead results, so that the 90%'ile was under the 15 ppb action level. The validity of samples showing low lead in the City's sampling was never questioned. This is a problem, because the City has now admitted that they do not know which homes had lead pipe, even though it is stated in writing in the report that all sampled homes had lead pipe. By law, at least 50 percent of the homes sampled must be verified to have lead pipe, and the remainder of homes sampled must have been built before 1986 and known to have lead solder. There is no basis for believing that this requirement was met in either the 2014 or 2015 LCR sampling events conducted by the City. Hence, the City of Flint has not had a valid LCR sampling event since the switch to Flint River water.

MDEQ then lowered the minimum number of required samples from 100 to 60, making it look like the City of Flint had met the target. MDEQ also did not question the City's open acknowledgement that homes from 2014 had not been re-sampled, or that high risk (Tier 1) sites were not used. The original report, due July 10th, was also late by several weeks. All of these violations of federal law were glossed over, to make it appear that the City had passed its lead testing with flying colors. Just like that, according to MDEQ at least, the City of Flint had no LCR violations at all.

> **ACLU-Michigan FOIA**. The timing by which the "revised" LCR report was created, is also of interest. On July 22, 2015, the ACLU-Michigan submitted a FOIA to MDEQ, requesting the City of Flint's LCR report supposedly due on July 10, 2015. The City's original LCR report with all the obvious problems is dated July 28, 2015. MDEQ never provided the ACLU-Michigan with the original LCR report. Instead, they created the scrubbed revised report, on August 20, 2015, and sent that report to ALCU-Michigan (from the

City of Flint) the next day. In the comments section of the report, Flint openly states ***"Revised report after conference call with DEQ staff. Two samples were removed from list for not meeting sample criteria, and due to population the number of samples was reduced to 60."***

> MDEQ to FlintWaterStudy.org FOIA: What conference call? On September 9, 2015, Virginia Tech submitted a FOIA to MDEQ explicitly requesting records and minutes of the conference call between DEQ staff and Flint cited in the revised LCR report. This FOIA request has been denied by MDEQ, because ***"Your request does not include the date/time of the conference call and who from the Department of Environmental Quality participated on the conference call."*** FlintWaterStudy.org immediately appealed the withholding of documents related to the conference call to the State of Michigan. On September 28th, our appeal was denied. We may commence a civil action if we do not agree with the decision.

> Handling Miguel Del Toral. MDEQ obviously had a major problem on its hands with EPA's lead-in-water expert Miguel Del Toral. On August 4th 2015, Citizen name / Ex. 6 and Citizen name / Ex. 6 met with MDEQ officials to discuss Flint's lead in water problems. The MDEQ officials participating in the meeting were identified by Citizen name / Ex. 6 and Citizen name / Ex. 6 as Liane Shekter-Smith (Chief of the Office of Drinking Water and Municipal Assistance), Stephen Busch and Brad Wurfel.

According to Citizen name / Ex. 6 and Citizen name / Ex. 6 Shekter-Smith bragged that ***"Mr. Del Toral has been handled,"*** and that Flint residents would not be hearing from him again. Moreover, MDEQ asserted that Mr. Del Toral's interim memo detailing the many problems with Flint's (non-existent) corrosion control program ***"would never be finalized."*** Just yesterday, NPR released a slightly different, but enlightening version of Wurfel's take on Del Toral and the memo:

MDEQ spokesman Brad Wurfel says the report was the work of a "rogue employee," and promised the final report — not yet released — would tell a much different story.

Citizen name / Ex. 6 and Citizen name / Ex. 6 vividly recall Wurfel, smirking or laughing, whenever they expressed concern about elevated lead in Flint's water. Looking back on the exchange yesterday, Mays stated ***"It is shocking how their refusal to admit they made a mistake, trumped the dangers their actions pose to Flint's children."***

Angered, Citizen name / Ex. 6 then called Edwards, and informed him that Del Toral would no longer be working on Flint water issues, and the two discussed the clear implication that EPA bureaucrats had intervened to prevent Del Toral from further exposing MDEQ's numerous blunders and the health threat to Flint residents. She further stated that ***"It is too late for my son, but I will not stand by and let this happen to another other innocent child in Flint."***

Clearly, the MDEQ, City of Flint and even the USEPA (with the obvious exception of Del Toral) have proved themselves unworthy of the public trust. Flint residents have been left to fend for themselves, when it comes to dealing with the dangers of high lead in their water.

FlintWaterStudy was launched an hour after the phone call from Citizen name / Ex. 6 o help the citizens of Flint deal with the lead-in-water crisis that MDEQ created, and to correct any false statements by uncaring agencies that have left Flint's children in harm's way.

Governor says fallout from Flint water switch wasn't fully understood

By Ron Fonger | rfonger1@mlive.com The Flint Journal

on September 30, 2015 at 4:32 PM

FLINT, MI -- Gov. Rick Snyder says "There are probably things that weren't as fully understood" as they should have been before the city tapped into the Flint River for drinking water.

Snyder, speaking to reporters in Lansing Wednesday, Sept. 30, said the decision to use the river rather than buying Lake Huron water from Detroit was "made with the community" while Flint was run by a state-appointed emergency manager.

The governor made the comments after announcing the appointment of University of Michigan attorney and law professor Joan Larsen to the state Supreme Court.

Snyder said the state is examining how to address Flint's water problems, including reports of increased levels of lead in tap water. "We've been actively working that issue for a significant period of time, and we've put a lot of additional resources in more recent days towards the issue," he said.

In response to a question about whether it was a mistake to use the Flint River for water in the city, Snyder said, "In terms of a mistake, we found there are probably things that weren't as fully understood when that switch was made."

"Again, we're looking at making sure they're within safe limits according to the federal government, and I would expect us to have more to talk about this subject before the end of the week, in terms of more tangible action items, not just what we're doing, but who we're partnering with -- Flint and the federal government."

Flint is in the midst of a health advisory after a study showing a sharp rise in the percentage of Flint children with elevated blood levels was released by a Hurley Medical Center doctor last week.

The study followed water testing by Virginia Tech university, which showed much higher lead in Flint tap water than the city's own testing had revealed.

In recent days, Flint Mayor Dayne Walling has said he believes the switch to the river increased the level of lead in water. City Administrator Natasha Henderson has made overtures to the Detroit Water and Sewerage Department about reconnecting as a water customer until the Karegnondi Water Authority pipeline to Lake Huron is completed.

Flint has struggled to treat Flint River water since ending purchases of Lake Huron water from Detroit in April 2014.

Snyder said Wednesday that he assisted in delivering 1,500 water filters in Flint last month not because he believed water required filtering, but because he wanted to help "nonprofits and others in terms of hopefully providing some items that people would perceive as helpful and give them more confidence and comfort in their water supply."

"I thought it was the right thing to do, to try to help people in some constructive way, and that was a positive step forward by working with people to help find those filters we did, and that may be part of this continuing process," Snyder said. "Again, making sure, though, people understand what the lead levels are, what's safe and not safe levels, and how to manage that in thoughtful way."

Officials with the Concerned Pastors for Social Action told The Flint Journal-MLive this week that the filters were given to them to distribute under the condition that the pastors not reveal the state's involvement in the distribution.

Dave Murray, a spokesman for Snyder, said there may have been a misunderstanding between representatives of the governor's office and the pastors.

"We asked the pastors to respect the wishes of the (anonymous) donor. We told the group that we were not necessarily looking for credit," Murray said in an email.

State officials responsible for overseeing the city water system have defended Flint water as meeting all requirements of the Safe Drinking Water Act.

Detroit water for Flint? DWSD lawyers say 'no comment'

By Ron Fonger | rfonger1@mlive.com The Flint Journal on September 30, 2015 at 12:19 PM

FLINT, MI -- A spokesman for the Detroit Water and Sewerage Department isn't commenting on the potential to reconnect the city of Flint to its water system.

"I have been advised by DWSD counsel that we have no comment at this time. I will let you know if that changes," DWSD spokesman Greg Eno said in an email to The Flint Journal-MLive.

The comment comes in the same week that Flint City Administrator Natasha Henderson said she and other Flint officials "have recognized there's a problem with lead" in the water Flint is producing from the Flint River.

Henderson said she left a message for DWSD Director Sue F. McCormick, who told the Flint City Council in January that the city could be reconnected to its supply of treated Lake Huron water.

The Journal could not reach McCormick for comment.

Henderson and other Flint officials declared a health advisory last week following the release of data showing an increase in the percentage of children showing elevated blood lead levels in Flint.

The city administrator is the latest public official to suggest reconnecting to the Detroit water system that Flint left in April 2014 after DWSD terminated an expired contract to sell the city water.

Unlike Genesee County, which continued to purchase water from Detroit on a short-term contract, former emergency manager Darnell Earley, supported by Mayor Dayne Walling, oversaw a shift by the city, which began treating water drawn from the Flint River.

Since that time, the city has struggled with issues including bacteria, elevated levels of total trihalomethanes and higher lead levels in tap water.

State Department of Environmental Quality and city officials have said the city currently meets all Safe Drinking Water Act requirements, including lead levels in tests distributed by the city and tested by the state.

Robert J. Daddow, chairman of the Great Lakes Water Authority, the group established to take over water and sewer operations in Wayne, Oakland and Macomb counties starting next year, said he spoke to Henderson this week but is not in a position to act.

Daddow said any deal to reconnect Flint to Detroit water would have to be struck with DWSD.

"I think DWSD approached Flint when they were having problems ... We (DWSD) were rebuffed," he said.

Genesee County Drain Commissioner Jeff Wright said Flint would be able to use a 9-mile section of water transmission pipe that the county purchased from the city last year if it goes back to buying DWSD water.

"But it has to be coordinated through Detroit," Wright said.

Wright proposed the purchase of the short section of pipe last year because the city no longer had a use for it and the county needed it as an intake to receive water from DWSD.

Snyder acknowledges some mistakes in tapping Flint River

Posted: Sep 30, 2015 1:03 PM CDT Updated: Sep 30, 2015 2:22 PM CDT

FLINT, MI (AP) -Gov. Rick Snyder is promising action this week in response to Flint's water crisis and says the consequences of switching to the Flint River in 2014 weren't "fully understood."

Blood samples show significant levels of lead in Flint children, likely because corrosive water from the Flint River is agitating lead in old plumbing systems.

Snyder spoke to reporters Wednesday after introducing a new Supreme Court justice. He acknowledged that lead levels have increased. The governor says "tangible action items" are coming.

The switch to the Flint River occurred when an emergency manager appointed by Snyder was running Flint.

The city's schools have urged students to avoid fountains and instead carry bottled water. Doctors last week urged Flint to stop using the river.

WNEM TV5 asked Gov. Snyder the Tough Questions today. We'll have his answers, tonight starting at 5.

500 cases of water to be handed out in giveaway

Posted: Sep 30, 2015 1:40 PM CDT Updated: Sep 30, 2015 1:40 PM CDT

FLINT, MI (WNEM/AP) -Following reports of lead contamination in the Flint water system, a local church is looking to help.

The House of Prayer MBC Outreach Ministry is planning a water giveaway Wednesday from 4-6 p.m.

The ministry plans to hand out around 500 free cases of water to residents who may not be able to afford it.

The issue developed after Flint moved off the Detroit water system and to the Flint River in 2014. Blood samples have shown significant increases in the levels of lead in children in the area, likely because corrosive water from the Flint River is agitating lead in old plumbing systems.

Governor Rick Snyder is now promising action this week in regards to the issue.

This will be House of Prayer's 3rd time distributing free cases of bottled water to residents this year.

You can take advantage of the giveaway by going to the House of Prayer MBC located at 1851 Carpenter road in Flint.

Snyder finally says lead in Flint water may be problem

By Nancy Kaffer, Detroit Free Press Columnist 8:38 p.m. EDT September 30, 2015

Almost a week after news broke that more Flint kids have been lead poisoned, two weeks after state data confirmed that lead levels in Flint's water had spiked, more than a year after residents first noticed something was hinky with the water coming out of their taps, Gov. Rick Snyder has publicly acknowledged that Flint's water supply "appears" to have problems.

Publicly, because despite his office's repeated efforts to downplay the severity of the situation, an anonymous water-filter distribution to Flint residents shepherded by

Snyder's office earlier this month, suggests that privately, the governor may have understood that something was amiss in this impoverished town.

It's a welcome, if weak, concession from Snyder.

Flint's decision to leave the Detroit Water and Sewerage Department and join a new water authority, and its subsequent decision to pump and locally treat water from the Flint River while the new system is under construction, were made while the city was under state oversight, led by emergency managers appointed by, and answerable to, Snyder.

Sara Wurfel, Snyder's press secretary, said Wednesday that a working group with members from the governor's office and the state departments of Health and Human Services, Treasury and Department of Environmental Quality has been meeting for months to develop a "more detailed action plan," which she expects to make public this week.

But Wurfel also insisted that elevated lead levels in Flint's water fall within federal guidelines, and thus aren't actionable. And she said that aging pipelines, which researchers say is the source of elevated lead levels in the Flint's water supply, are a problem across the state.

Lead poisoning is irreversible; children affected by it have behavioral and developmental problems. The rate of childhood lead poisoning had been declining in Flint and in the state for decades. But in some Flint ZIP codes, the percentage of lead-poisoned children has doubled since the city began to draw water from the Flint River, according to blood test results analyzed and released last week by a Hurley Medical Center researcher. A Free Press analysis of state data bolsters those findings.

Now, Snyder has conceded that "it appears that (water) lead levels could be higher or have increased," and that there are "probably things that weren’t fully understood when the switch was made."

By July of this year, the administration should have known.

A memo written in July by a U.S. Environmental Protection Agency water regulations manager and leaked to the American Civil Liberties Union details post-switch problems: The water Flint once purchased from DWSD had been treated with the appropriate chemicals to make it safe, not just for human consumption, but for passage through aging infrastructure.

Because Flint didn't continue that treatment after it began pumping river water, and because the service lines that carry water through Flint's system are rife with lead and copper, those metals have leached into the city's drinking water, the EPA manager wrote: "Which is to be expected in a public water system that is not providing corrosion control treatment."

The EPA manager also questioned the methods -- endorsed by the MDEQ -- used to collect Flint water samples, specifically, advice to "pre-flush" pipes. The memo's author said that samples taken using this method would likely return results that underestimate the amount of lead in drinking water.

(When asked about the EPA memo in July, MDEQ spokesman Brad Wurfel told Michigan Radio: “Let me start here – anyone who is concerned about lead in the drinking water in Flint can relax.” He went on to say that the home of the Flint resident whose son's blood-lead levels prompted the EPA's involvement was "an outlier," and that there didn't appear to be a "broad problem" with Flint River water releasing lead into drinking water.)

So, Snyder has acknowledged the problem, if in vague terms, and promised tangible assistance. When asked what the state has done so far, Snyder spokeswoman Sara Wurfel pointed to the working group and state funding for improvements to Flint's water infrastructure. The state also allowed Flint to restructure some loan payments; that freed up about $2.4 million over two years to fix immediate problems of discoloration and odor found in Flint water after the switch and more pipeline replacement.

Considering Flint's financial status, that's certainly welcome help. But none of these efforts provide an immediate response to the reported increase of lead levels in either the water system, or in Flint children's blood.

Wurfel said the city is working to gather additional data about the Flint water supply.

But I'm inclined to believe that the city's needs are more pressing.

U.S. Rep. Dan Kildee, D-Flint, asked Snyder in a Sept. 29 letter to provide state funding for lead-clearing filters for Flint residents, issue a state health advisory -- in addition to the advisories already released by Flint and Genesee County -- conduct independent, widespread water testing, and to formally request help from federal agencies.

Those would be good places to start. But not to stop.

Snyder: Things "were not fully understood" in Flint water switch

Rick Pluta, Michigan Radio • 11 hours ago

Governor Rick Snyder acknowledges the decision to switch the city of Flint's water system was not vetted the way it should have been. The city faces a crisis now that the water going to homes is contaminated by lead.

“In terms of a mistake, I would say is there are probably things that were not as fully understood as when that switch was made,” he said.

What was not “fully understood” is how corrosive the Flint River’s water is and that the switch would result in elevated lead levels.

This is the first time the governor has said the decision to switch the city from the Detroit water system and draw water, instead, from the Flint River was not well planned.

The governor’s office also participated in a plan to distribute water filters in the city while insisting the water was safe to drink.

The governor says steps will be announced later this week to try to rectify the situation.

Legislative Black Caucus urges state of emergency for Flint water

By Jiquanda Johnson | jjohns16@mlive.com
The Flint Journal on September 30, 2015 at 6:46 PM, updated September 30, 2015 at 11:14 PM

FLINT, MI — The Michigan Legislative Black Caucus is putting pressure on Gov. Rick Snyder to issue a state of emergency for the city of Flint's water problems.

The organization announced in a Wednesday, Sept. 30, release that its members are concerned about the residents of Flint and lead exposure from the city's water.

The release cited blood samples from Genesee County children that show lead levels have increased since the city severed ties from the Detroit Water and Sewerage Department and began using water from the Flint River last year.

According to the release, state Rep. Sheldon Neeley, D-Flint, is working with local, state and federal officials to find solutions and resources.

"Issuing a health emergency is the most responsible thing to do," said Neeley, first vice chairman of the Legislative Black Caucus. "This is a public health crisis, and our children are most at risk. We urge Gov. Snyder to issue the state of emergency so the city of Flint can get immediate monetary relief."

If Snyder declares a state of emergency, the city could gain access to federal funding, the caucus said.

Andrea— Susan is asking STPB if the lead filters (capital expense) are DWSRF loan eligible, which they are. Now the question has gone to OGC as to whether the replacement filters are DWSRF-eligible; are they O&M—which I think they are, then they are not DWSRF eligible. Not sure if any replacement filter would not be considered O&M, even if it was a 12-month filter. Do you know what type of lead filters are being purchased currently for Flint citizens? I know the Brita pitcher filters don't remove lead; I think they're purchasing filters that attach to the home faucet, right?

Jennifer
